

# PCF85263A

Tiny Real-Time Clock/calendar with alarm function, battery switch-over, time stamp input, and I<sup>2</sup>C-bus

Rev. 4.1 — 27 November 2015

Product data sheet

## 1. General description

---

The PCF85263A is a CMOS<sup>1</sup> Real-Time Clock (RTC) and calendar optimized for low power consumption and with automatic switching to battery on main power loss. The RTC can also be configured as a stop-watch (elapsed time counter). Three time log registers triggered from battery switch-over as well as input driven events. Featuring clock output and two independent interrupt signals, two alarms, I<sup>2</sup>C interface and quartz crystal calibration.

For a selection of NXP Real-Time Clocks, see [Table 72 on page 90](#)

## 2. Features and benefits

---

- UL Recognized Component (PCF85263ATL)
- Provides year, month, day, weekday, hours, minutes, seconds and 100th seconds based on a 32.768 kHz quartz crystal
- Stop-watch mode for elapsed time counting. From 100th seconds to 999999 hours
- Two independent alarms
- Battery back-up circuit
- WatchDog timer
- Three timestamp registers
- Two independent interrupt generators plus predefined interrupts at every second, minute, or hour
- Frequency adjustment via programmable offset register
- Clock operating voltage: 0.9 V to 5.5 V
- Low current; typical 0.28  $\mu$ A at  $V_{DD} = 3.0$  V and  $T_{amb} = 25$  °C
- 400 kHz two-line I<sup>2</sup>C-bus interface (at  $V_{DD} = 1.8$  V to 5.5 V)
- Programmable clock output for peripheral devices (32.768 kHz, 16.384 kHz, 8.192 kHz, 4.096 kHz, 2.048 kHz, 1.024 kHz, and 1 Hz)
- Configurable oscillator circuit for a wide variety of quartzes:  $C_L = 6$  pF,  $C_L = 7$  pF, and  $C_L = 12.5$  pF

## 3. Applications

---

- Printers and copiers
- Electronic metering
- Digital cameras

---

1. The definition of the abbreviations and acronyms used in this data sheet can be found in [Section 24](#).

- White goods
- Elapsed time counter
- Network powered devices
- Battery backed up systems
- Data loggers
- Digital voice recorders
- Mobile equipment
- Accurate high duration timer

## 4. Ordering information

Table 1. Ordering information

| Type number  | Package    |  |           |
|--------------|------------|--|-----------|
|              | Name       | Description  | Version   |
| PCF85263AT   | SO8        | plastic small outline package; 8 leads; body width 3.9 mm  | SOT96-1   |
| PCF85263ATL  | DFN2626-10 | plastic thermal enhanced extremely thin small outline package; no leads; 10 terminals; body 2.6 × 2.6 × 0.5 mm | SOT1197-1 |
| PCF85263ATT  | TSSOP8     | plastic thin shrink small outline package; 8 leads; body width 3 mm  | SOT505-1  |
| PCF85263ATT1 | TSSOP10    | plastic thin shrink small outline package; 10 leads; body width 3 mm   | SOT552-1  |

### 4.1 Ordering options

Table 2. Ordering options

| Product type number | Orderable part number | Sales item (12NC) | Delivery form          | IC revision |
|---------------------|-----------------------|-------------------|------------------------|-------------|
| PCF85263AT/A        | PCF85263AT/AJ         | 935302207118      | tape and reel, 13 inch | 1           |
| PCF85263ATL/A       | PCF85263ATL/AX        | 935302602115      | tape and reel, 7 inch  | 1           |
| PCF85263ATT/A       | PCF85263ATT/AJ        | 935304459118      | tape and reel, 13 inch | 1           |
| PCF85263ATT1/A      | PCF85263ATT1/AJ       | 935304461118      | tape and reel, 13 inch | 1           |

## 5. Marking

Table 3. Marking codes

| Product type number | Marking code |
|---------------------|--------------|
| PCF85263AT/A        | 85263A       |
| PCF85263ATL/A       | 263A         |
| PCF85263ATT/A       | 263A         |
| PCF85263ATT1/A      | 263A         |

## 7. Pinning information

### 7.1 Pinning

## 7.2 Pin description

**Table 4. Pin description**

Input or input/output pins must always be at a defined level ( $V_{SS}$  or  $V_{DD}$ ) unless otherwise specified.

| Symbol                              | Pin              |                          |                      |                        | Type             | Description  |   |
|-------------------------------------|------------------|--------------------------|----------------------|------------------------|------------------|--|---|
|                                     | PCF85263AT (SO8) | PCF85263ATL (DFN2626-10) | PCF85263ATT (TSSOP8) | PCF85263ATT1 (TSSOP10) |                  | Primary use  | Secondary use   |
| OSCI                                | 1                | 1                        | 1                    | 1                      | input            | oscillator input   | -   |
| OSCO                                | 2                | 2                        | 2                    | 2                      | output           | oscillator output  | -   |
| VBAT                                | 3                | 3                        | 3                    | 3                      | supply           | battery backup supply voltage <sup>[1]</sup>                                       | -   |
| TS (CLK/ $\overline{\text{INTB}}$ ) | -                | 4                        | -                    | 4                      | input/<br>output | can be configured with TSPM[1:0] <sup>[2]</sup><br>timestamp input                 | $\overline{\text{INTB}}$ and CLK output (push-pull); stop-watch control |
| VSS                                 | 4                | 5 <sup>[3]</sup>         | 4                    | 5                      | supply           | ground supply voltage  | -   |
| SDA                                 | 5                | 6                        | 5                    | 6                      | input/<br>output | serial data line   | -   |
| SCL                                 | 6                | 7                        | 6                    | 7                      | input            | serial clock input   | -   |
| CLK                                 | -                | 8                        | -                    | 8                      | output           | CLK (push-pull)  | -   |
| $\overline{\text{INTA}}$ (CLK)      | 7                | 9                        | 7                    | 9                      | output           | can be configured with INTAPM[1:0] <sup>[4]</sup><br>interrupt output (open-drain) | CLK output (open-drain)   |
| VDD                                 | 8                | 10                       | 8                    | 10                     | supply           | supply voltage   | -   |

[1] Connect to  $V_{DD}$  if not used.

[2] See [Table 7](#) and [Table 47](#).

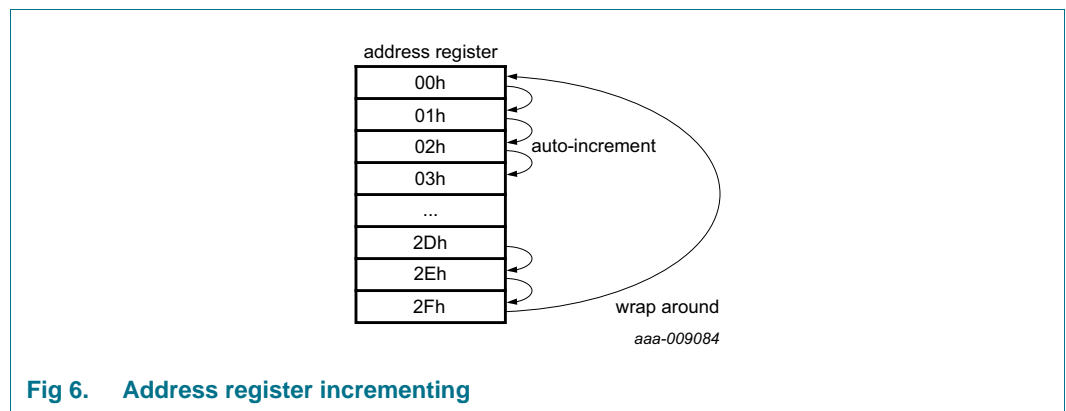

[3] The die paddle (exposed pad) is connected to  $V_{SS}$  through high ohmic (non-conductive) silicon attach and should be electrically isolated. It is good engineering practice to solder the exposed pad to an electrically isolated PCB copper pad as shown in [Figure 45 "Package outline SOT1197-1 \(DFN2626-10\), PCF85263ATL"](#) for better heat transfer but it is not required as the RTC doesn't consume much power. In no case should traces be run under the package exposed pad.

[4] See [Table 7](#) and [Table 49](#).

## 8. Functional description

The PCF85263A contains 8-bit registers for time information, for timestamp information and registers for system configuration. Included is an auto-incrementing register address, an on-chip 32.768 kHz oscillator with integrated capacitors, a frequency divider which provides the source clock for the Real-Time Clock (RTC) and calendar, and an I<sup>2</sup>C-bus interface with a maximum data rate of 400 kbit/s.

The built-in address register will increment automatically after each read or write of a data byte. After register 2Fh, the auto-incrementing will wrap around to address 00h (see [Figure 6](#)).

**Fig 6. Address register incrementing**

All registers (see [Table 5 on page 9](#), [Table 6 on page 11](#), and [Table 7 on page 13](#)) are designed as addressable 8-bit parallel registers although not all bits are implemented. [Figure 7](#) gives an overview of the address map.

**Fig 7. Register map**

The 100th seconds, seconds, minutes, hours, days, months, and years as well as the corresponding alarm registers are all coded in Binary Coded Decimal (BCD) format. When one of the RTC registers is read, the contents of all time counters are frozen. Therefore, faulty reading of the clock and calendar during a carry condition is prevented.

## 8.1 Registers organization overview

### 8.1.1 Time mode registers

The PCF85263A has two time mode register sets, one for the real-time clock mode and one for the stopwatch clock mode. The access to these registers can be switched by the RTCM bit in the Function control register (28h), see [Table 7 on page 13](#) and [Table 54 on page 55](#).

Fig 8. Time mode register set selection

## 8.1.1.1 RTC mode time registers overview (RTCM = 0)

**Table 5. RTC mode time registers**

Bit positions labeled as - are not implemented. After reset, all registers are set according to [Table 62 on page 59](#).

| Address                            | Register name   | Bit                     |                      |                                     |                                     |         |                      |          |          | Reference                   |                             |

### 8.2 RTC mode time and date registers

RTC mode is enabled by setting RTCM = 0. These registers are coded in the BCD format to simplify application use.

Default state is:

**Time** — 00:00:00.00

**Date** — 2000 01 01

**Weekday** — Saturday

**Monitor bits** — OS = 1, EMON = 0

**Table 8. Time and date registers in RTC mode (RTCM = 0)**

Bit positions labeled as - are not implemented and return 0 when read.

| Address | Register name                | Upper-digit (ten's place) |        |        |        | Digit (unit place) |        |       |       |
|---------|------------------------------|---------------------------|--------|--------|--------|--------------------|--------|-------|-------|

| 05h     | Weekdays                     | -                         | -      | -      | -      | -                  | 0 to 6 |       |       |
| 06h     | Months                       | -                         | -      | -      | 0 to 1 | 0 to 9             |        |       |       |
| 07h     | Years                        | 0 to 9                    |        |        |        | 0 to 9             |        |       |       |

[1] The 100th\_seconds register is only available when the 100TH mode is enabled, see [Section 8.13.1](#). When the 100TH mode is disabled, this register always returns 0.

[2] Hour mode is set by the 12\_24 bit in the Oscillator register, see [Section 8.10 on page 42](#).

[3] If the year counter contains a value, which is exactly divisible by 4, the PCF85263A compensates for leap years by adding a 29th day to February.

#### 8.2.1 Definition of BCD

The Binary-Coded Decimal (BCD) is an encoding of numbers where each digit is represented by a separate bit field. Each bit field may only contain the values 0 to 9. In this way, decimal numbers and counting is implemented.

Example: 59 encoded as an entire number is represented by 3Bh or 111011. In BCD the 5 is represented as 5h or 0101 and the 9 as 9h or 1001 which combines to 59h.

Table 9. BCD coding

| Value in decimal | Upper-digit (ten's place) |       |       |       | Digit (unit place) |       |       |       |
|------------------|---------------------------|-------|-------|-------|--------------------|-------|-------|-------|
|                  | Bit 7                     | Bit 6 | Bit 5 | Bit 4 | Bit 3              | Bit 2 | Bit 1 | Bit 0 |
| 00               | 0                         | 0     | 0     | 0     | 0                  | 0     | 0     | 0     |
| 01               | 0                         | 0     | 0     | 1     | 0                  | 0     | 0     | 1     |
| 02               | 0                         | 0     | 1     | 0     | 0                  | 0     | 1     | 0     |
| :                | :                         | :     | :     | :     | :                  | :     | :     | :     |
| 09               | 1                         | 0     | 0     | 1     | 1                  | 0     | 0     | 1     |
| 10               | 0                         | 0     | 0     | 0     | 0                  | 0     | 0     | 0     |
| :                | :                         | :     | :     | :     | :                  | :     | :     | :     |
| 98               | 1                         | 0     | 0     | 1     | 1                  | 0     | 0     | 0     |
| 99               | 1                         | 0     | 0     | 1     | 1                  | 0     | 0     | 1     |

### 8.2.2 OS: Oscillator stop

When the oscillator of the PCF85263A is stopped, the OS status bit is set. The oscillator can be stopped, for example, by connecting one of the oscillator pins OSCI or OSCO to ground. The oscillator is considered to be stopped during the time between power-on and stable crystal resonance. This time can be in the range of 200 ms to 2 s depending on crystal type, temperature, and supply voltage.

The status bit remains set until cleared by command (see [Figure 9](#)). If the bit cannot be cleared, then the oscillator is not running. This method can be used to monitor the oscillator and to determine if the supply voltage has reduced to the point where oscillation fails.

Fig 9. OS status bit

### 8.2.3 EMON: event monitor

The EMON can be used to monitor the status of all the flags in the Flags register, see [Section 8.14 on page 57](#). When one or more of the flags is set, then the EMON bit returns a logic 1. The EMON bit cannot be cleared. EMON returns a logic 0 when all flags are cleared.

See [Figure 22 on page 41](#) for a pictorial representation.

### 8.2.4 Definition of weekdays

Definition may be reassigned by the user.

Table 10. Weekday assignments

| Day       | Bit |   |   |
|-----------|-----|---|---|
|           | 2   | 1 | 0 |
| Sunday    | 0   | 0 | 0 |
| Monday    | 0   | 0 | 1 |
| Tuesday   | 0   | 1 | 0 |
| Wednesday | 0   | 1 | 1 |
| Thursday  | 1   | 0 | 0 |
| Friday    | 1   | 0 | 1 |
| Saturday  | 1   | 1 | 0 |

### 8.2.5 Definition of months

Table 11. Month assignments in BCD format

| Month     | Upper-digit<br>(ten's place) | Digit (unit place) |       |       |       |
|-----------|------------------------------|--------------------|-------|-------|-------|
|           | Bit 4                        | Bit 3              | Bit 2 | Bit 1 | Bit 0 |
| January   | 0                            | 0                  | 0     | 0     | 1     |
| February  | 0                            | 0                  | 0     | 1     | 0     |
| March     | 0                            | 0                  | 0     | 1     | 1     |
| April     | 0                            | 0                  | 1     | 0     | 0     |
| May       | 0                            | 0                  | 1     | 0     | 1     |
| June      | 0                            | 0                  | 1     | 1     | 0     |
| July      | 0                            | 0                  | 1     | 1     | 1     |
| August    | 0                            | 1                  | 0     | 0     | 0     |
| September | 0                            | 1                  | 0     | 0     | 1     |
| October   | 1                            | 0                  | 0     | 0     | 0     |
| November  | 1                            | 0                  | 0     | 0     | 1     |
| December  | 1                            | 0                  | 0     | 1     | 0     |

### 8.2.6 Setting and reading the time in RTC mode

Figure 10 shows the data flow and data dependencies starting from the 100 Hz clock tick.

Fig 10. Data flow for the time function

During read operations, the time counting circuits (memory locations 00h through 07h) are copied into an output register. The RTC continues counting in the background.

When reading or writing the time it is very important to make a read or write access in one go, that is, setting or reading 100th seconds through to years should be made in one single access. Failing to comply with this method could result in the time becoming corrupted.

As an example, if the time (seconds through to hours) is set in one access and then in a second access the date is set, it is possible that the time increments between the two accesses. A similar problem exists when reading. A roll-over may occur between reads thus giving the minutes from one moment and the hours from the next.

Before setting the time, the STOP bit should be set and the prescalers should be cleared (see [Section 8.16 "Stop\\_enable register" on page 60](#)).

An example of setting the time: 14 hours, 23 minutes and 19 seconds.

- I<sup>2</sup>C START condition
- I<sup>2</sup>C slave address + write (A2h)
- register address (2Eh)
- write data (set STOP, 01h)

- write data (clear prescaler, A4h)
- write data (100th seconds, 00h)
- write data (Hours, 14h)
- write data (Minutes, 23h)
- write data (Seconds, 19h)
- I<sup>2</sup>C START condition
- I<sup>2</sup>C slave address + write (A2h)
- register address (2Eh)
- write data (clear STOP, 00h). Time starts counting from this point
- I<sup>2</sup>C STOP condition

### 8.3 Stop-watch mode time registers

These registers are coded in the BCD format to simplify application use.

Stop-watch mode is enabled by setting RTCM = 1. In stop-watch mode, the PCF85263A counts from 100th seconds to 999999 hours. There are no days, weekdays, months or year registers.

Default state is:

**Time** — 000000:00:00.00

**Monitor bits** — OS = 1, EMON = 0 (see [Section 8.2.2 on page 15](#) and [Section 8.2.3 on page 15](#))

**Table 12. Time registers in stop-watch mode (RTCM = 1)**

*Bit positions labeled as - are not implemented and return 0 when read.*

| Address | Register name                | Upper-digit (ten's place) |        |       |       | Digit (unit place) |       |       |       |
|---------|------------------------------|---------------------------|--------|-------|-------|--------------------|-------|-------|-------|
|         |                              | Bit 7                     | Bit 6  | Bit 5 | Bit 4 | Bit 3              | Bit 2 | Bit 1 | Bit 0 |
| 00h     | 100th_seconds <sup>[1]</sup> | 0 to 9                    |        |       |       | 0 to 9             |       |       |       |
| 01h     | Seconds                      | OS                        | 0 to 5 |       |       | 0 to 9             |       |       |       |
| 02h     | Minutes                      | EMON                      | 0 to 5 |       |       | 0 to 9             |       |       |       |
| 03h     | Hours_xx_xx_00               | 0 to 9                    |        |       |       | 0 to 9             |       |       |       |
| 04h     | Hours_xx_00_xx               | 0 to 9                    |        |       |       | 0 to 9             |       |       |       |
| 05h     | Hours_00_xx_xx               | 0 to 9                    |        |       |       | 0 to 9             |       |       |       |
| 06h     | not used                     | -                         | -      | -     | -     | -                  | -     | -     | -     |
| 07h     | not used                     | -                         | -      | -     | -     | -                  | -     | -     | -     |

[1] The 100th\_seconds register is only available when the 100TH mode is enabled, see [Section 8.13.1 on page 54](#). When the 100TH mode is disabled, this register always returns 0.

#### 8.3.1 Setting and reading the time in stop-watch mode

[Figure 11](#) shows the data flow and data dependencies starting from the 100 Hz clock tick.

During read operations, the time counting circuits (memory locations 00h through 07h) are copied into an output register. The RTC continues counting in the background.

When reading or writing the time it is very important to make a read or write access in one go, that is, setting or reading 100th\_seconds through to HR\_00\_xx\_xx should be made in one single access. Failing to comply with this method could result in the time becoming corrupted.

As an example, if the seconds value is set in one access and then in a following access the minutes value is set, it is possible that the time increments between the two accesses. A similar problem exists when reading. A roll-over may occur between reads thus giving the seconds from one moment and the minutes from the next.

Fig 11. Data flow for the stop-watch function

## 8.4 Alarms

There are two independent alarms. Each is separately configured and may be used to generate an interrupt. In RTC mode, an alarm is configured for time and date. In stop-watch mode when the RTC is functioning as an elapsed time counter, an alarm is configured for time only.

### 8.4.1 Alarms in RTC mode

In RTC mode, Alarm 1 can be configured from seconds to months. Alarm 2 operates on minutes, hours and weekday. Each segment of the time is independently enabled. Alarms can be output on the INTA and INTB pins.

#### 8.4.1.1 Alarm1 and alarm2 registers in RTC mode

Setting the time for alarm1: Only the information which is relevant for the alarm condition must to be programmed. The unused parts are ignored.

**Table 13. Alarm1 and alarm2 registers in RTC mode coded in BCD (RTCM = 0)**  
 Bit positions labeled as - are not implemented.

| Address                     | Register name  | Upper-digit (ten's place) |        |        |        | Digit (unit place) |        |       |       |
|-----------------------------|----------------|---------------------------|--------|--------|--------|--------------------|--------|-------|-------|
|                             |                | Bit 7                     | Bit 6  | Bit 5  | Bit 4  | Bit 3              | Bit 2  | Bit 1 | Bit 0 |

[1] Default value.

### 8.4.1.3 Alarm1 and alarm2 function in RTC mode

The registers at addresses 08h through 0Ch contain alarm1 information. When one or more of these registers is loaded with second, minute, hour, day, or month, and its corresponding alarm enable bit (SEC\_A1E to MON\_A1E) is set logic 1, then that information is compared with the current second, minute, hour, day, and month.

The registers at addresses 0Dh through 0Fh contain alarm2 information. When one or more of these registers is loaded with minute, hour or weekday, and its corresponding alarm enable bit (MIN\_A2E to WDAY\_A2E) is set logic 1, then that information is compared with the current minute, hour and weekday.

Alarm registers which have their alarm enable bit at logic 0 are ignored.

When the time increments to match the enabled alarms, the alarm flag in the Flags register ([Section 8.14 on page 57](#)) is set. A1F for alarm1 and A2F for alarm2. The alarm flag is cleared by command.

When the time increments to match the enabled alarms, an interrupt can be generated. See [Section 8.4.3 "Alarm interrupts"](#).

## 8.4.2 Alarms in stop-watch mode

In stop-watch mode, Alarm 1 can be configured from seconds to 999999 hours. Alarm 2 operates on minutes up to 9999 hours.

### 8.4.2.1 Alarm1 and alarm2 registers in stop-watch mode

Setting the time for alarm1 and alarm2: Only the information which is relevant for the alarm condition must to be programmed. The unused parts are ignored.

**Table 15. Alarm1 and alarm2 registers in stop-watch mode coded in BCD (RTCM = 1)**  
Bit positions labeled as - are not implemented.

[1] Default value.

### 8.4.2.3 Alarm1 and alarm2 function in stop-watch mode

The registers at addresses 08h through 0Ch contain alarm1 information. When one or more of these registers is loaded with second, minute, and hours, and its corresponding alarm enable bit (SEC\_A1E to HR\_00\_XX\_XX\_A1E) is set logic 1, then that information is compared with the current second, minute, and hours.

The registers at addresses 0Dh through 0Fh contain alarm2 information. When one or more of these registers is loaded with minute and hours, and its corresponding alarm enable bit (MIN\_A2E to HR\_00\_XX\_A2E) is set logic 1, then that information is compared with the current minute and hours.

Alarm registers which have their alarm enable bit at logic 0 are ignored.

When the time increments to match the enabled alarms, the alarm flag in the Flags register ([Section 8.14 on page 57](#)) is set. A1F for alarm1 and A2F for alarm2. The alarm flag is cleared by command.

When the time increments to match the enabled alarms, an interrupt can be generated. See [Section 8.4.3 "Alarm interrupts"](#).

### 8.4.3 Alarm interrupts

The generation of interrupts from the alarm functions is controlled via the alarm interrupt enable bits; A1IEA, A1IEB, A2IEA, A2IEB. These bits are in registers INTA\_enable (address 29h) and INTB\_enable (address 2Ah).

The assertion of flags A1F or A2F can be used to generate an interrupt at the pins  $\overline{\text{INTA}}$  and  $\overline{\text{INTB}}$ . The interrupt may be generated as a pulse signal every time the time increments to match the alarm setting or as a permanently active signal which follows the condition of bit A1F and/or A2F. See [Section 8.9 on page 38](#) for interrupt control.

A1F and A2F remain set until cleared by command. Once an alarm flag has been cleared, it will only be set again when the time increments to match the alarm condition once more.

When an interrupt pin is configured to pulse mode and if an alarm flag is not cleared and the time increments to match the alarm condition again, then a repeated interrupt pulse will be generated.

## 8.5 WatchDog

Table 17. WatchDog - WatchDog control and register (address 2Dh) bit description

| Bit    | Symbol   | Value                    | Description                              |
|--------|----------|--------------------------|--|
| 7      | WDM      |                          | <b>WatchDog mode</b>                     |
|        |          | 0 <sup>[1]</sup>         | single shot                              |
|        |          | 1                        | repeat mode                              |
| 6 to 2 | WDR[4:0] |                          | <b>WatchDog register bits</b>            |
|        |          | 0h <sup>[1]</sup> to 1Fh | Write: WatchDog counter load value       |
|        |          | 0h to 1Fh                | Read: current counter value              |
| 1 to 0 | WDS[1:0] |                          | <b>WatchDog step size (source clock)</b> |
|        |          | 00 <sup>[1]</sup>        | 4 seconds (0.25 Hz)                      |
|        |          | 01                       | 1 second (1 Hz)                          |
|        |          | 10                       | 1/4 second (4 Hz)                        |
|        |          | 11                       | 1/16 second (16 Hz)                      |

[1] Default value.

### 8.5.1 WatchDog functions

The WatchDog has four selectable step sizes allowing for periods in the range from 62.5 ms to 124 seconds. For periods greater than 2 minutes, the alarm function can be used.

$$\text{WatchDog-duration} = \text{WDR} \times \text{stepsize} \tag{1}$$

Table 18. WatchDog durations

| WDS[1:0] | WatchDog step size <sup>[1]</sup> | Delay                                |                                       |
|----------|-----------------------------------|--------------------------------------|---------------------------------------|
|          |                                   | Minimum WatchDog duration<br>WDR = 1 | Maximum WatchDog duration<br>WDR = 31 |
| 00       | 4 s                               | 4 s                                  | 124 s                                 |
| 01       | 1 s                               | 1 s                                  | 31 s                                  |
| 10       | 1/4 s                             | 0.25 s                               | 7.75 s                                |
| 11       | 1/16 s                            | 0.0625 s                             | 1.9375 s                              |

[1] Time periods can be affected by correction pulses.

**Remark:** Note that all timings are generated from the 32.768 kHz oscillator and are based on the assumption that there is 0 ppm deviation. Deviation in oscillator frequency results in deviation in timings. This is not applicable to interface timing.

The WatchDog counts down from a software-loaded 5-bit binary value, WDR[4:0], in register WatchDog. Loading the counter with 0 stops the WatchDog. Loading the counter with a non-0 value starts the counter. Values from 1 to 31 are allowed.

If a new value of WDR[4:0] is written before the end of the current WatchDog period, then this value takes immediate effect.

When starting the timer for the first time or when reloading WDR[4:0] before the end of the current period, the first period has an uncertainty of maximum one count. The uncertainty is a result of loading the WDR[4:0] from the interface clock which is asynchronous from the WatchDog source clock. Subsequent WatchDog periods do not have such variation.

Reading the WatchDog register returns the current value of the WatchDog counter (see [Figure 14](#)) and **not** the initial value WDR[4:0]. Since it is not possible to freeze the WatchDog counter during read back, it is recommended to read the register twice and check for consistent results.

**8.5.1.1 WatchDog repeat mode**

In repeat mode, at the end of every WatchDog period, the WatchDog flag (bit WDF in the Flags register, [Section 8.14 on page 57](#)) is set and the counter automatically reloads and starts the next WatchDog period. An example is given in [Figure 14](#). The asserted bit WDF can be used to generate an interrupt. Bit WDF can only be cleared by command.

**8.5.1.2 WatchDog single shot mode**

In single shot mode, at the end of the countdown period, the WatchDog flag (bit WDF in the Flags register, [Section 8.14 on page 57](#)) is set and the counter stops with the value 0. The WatchDog register must be reloaded to start another WatchDog period.

Fig 15. WatchDog single shot mode

### 8.5.1.3 WatchDog interrupts

The generation of interrupts from the WatchDog functions is controlled via the WatchDog interrupt enable bits; WDIEA and WDIEB. These bits are in registers INTA\_enable (address 29h) and INTB\_enable (address 2Ah).

The assertion of the flag WDF can be used to generate an interrupt at pins  $\overline{\text{INTA}}$  and  $\overline{\text{INTB}}$ . The interrupt may be generated as a pulsed signal every time the WatchDog counter reaches the end of the countdown period. Alternatively as a permanently active signal which follows the condition of bit WDF. WDF remains set until cleared by command.

When enabled, interrupts are triggered every time the WatchDog counter reaches the end of the countdown period and even if the WDF is not cleared, an interrupt pulse can be generated.

See [Section 8.9 on page 38](#) for interrupt control.

## 8.6 RAM byte

Table 19. RAM\_byte - 8-bit RAM register (address 2Ch) bit description

| Bit    | Symbol | Value                               | Description |
|--------|--------|-------------------------------------|-------------|
| 7 to 0 | B[7:0] | 00000000 <sup>[1]</sup> to 11111111 | RAM content |

[1] Default value.

The PCF85263A provides a free RAM byte, which can be used for any purpose, for example, status bits of the system.

## 8.7 Timestamps

There are three timestamp registers which can be independently configured to record the time for battery switch-over events and/or transitions on the TS pin.

Each timestamp register has an associated flag. It is also possible to generate an interrupt signal for every timestamp register update.

Timestamps work in both RTC and stop-watch mode. During battery operation, the mechanical switch detector may also be used to trigger the timestamp.

The timestamp registers are read only and cannot be written. It is possible to set all three registers to 0 with the CTS instruction in the Resets register ([Section 8.15 on page 58](#)).

Fig 16. Timestamp

The mode for each register is controlled by the TSR\_mode register.

**Table 20. TSR\_mode - timestamp mode control register (address 23h) bit description**

| Bit                      | Symbol     | Value              | Description   |
|--------------------------|------------|--------------------|---|
| <b>Timestamp3 (TSR3)</b> |            |                    |   |
| 7 to 6                   | TSR3M[1:0] |                    | <b>timestamp register 3 mode</b>                                    |

|                          |            | 110 to 111         | no timestamp  |
| <b>Timestamp1 (TSR1)</b> |            |                    |   |
| 1 to 0                   | TSR1M[1:0] |                    | <b>timestamp register 1 mode</b>                                    |
|                          |            | 00 <sup>[1]</sup>  | no timestamp  |
|                          |            | 01                 | FE, record <b>F</b> irst TS pin <b>E</b> vent                       |
|                          |            | 10                 | LE, record <b>L</b> ast TS pin <b>E</b> vent                        |
|                          |            | 11                 | no timestamp  |

[1] Default value.

**First event** means that the time is only stored on the first event and not recorded for subsequent events. When the first event occurs, the associated timestamp flag is set. When the flag is cleared, then a new 'first' event is recorded. See [Figure 17](#) and [Figure 18](#).

**Last event** means that the time is stored on every event. When an event occurs, the associated timestamp flag is set. It is not necessary to clear the flag before a new event is recorded.

Interrupts can be generated in  $\overline{\text{INTA}}$  pin and/or  $\overline{\text{INTB}}$  pin. Interrupts are generated every time a timestamp register is updated. Interrupt generation is not conditional on the state of the timestamp flags. See [Section 8.7.1](#).

Fig 17. Example battery switch-over timestamp

Fig 18. Example TS pin driven timestamp

The recorded time is stored in the associated timestamp register. The time format depends on the RTC mode. The timestamp registers follows the time format of the time registers.

**Table 21. Timestamp registers in RTC mode (RTCM = 0)**

Bit positions labeled as - are not implemented and return 0 when read.

| Address                      | Register name | Upper-digit (ten's place) |        |        |        | Digit (unit place) |       |       |       |
|------------------------------|---------------|---------------------------|--------|--------|--------|--------------------|-------|-------|-------|

### 8.7.1 Timestamps interrupts

The generation of interrupts from the timestamp functions is controlled via the timestamp interrupt enable bits; TSRIEA and TSRIEB. These bits are in registers INTA\_enable (address 29h) and INTB\_enable (address 2Ah).

The loading of new information into one of the timestamp registers can be used to generate an interrupt at pins INTA and INTB. The interrupt may be generated as a pulsed signal every time a timestamp register updates or as a permanently active signal which follows the condition of timestamp flags, TSR1F to TSR3F. The timestamp flags remain set until cleared by command.

When enabled, interrupts are triggered every time a timestamp register updates and even if the associated flag is not cleared, an interrupt pulse can be generated.

See [Section 8.9 on page 38](#) for interrupt control.

## 8.8 Offset register

The PCF85263A incorporates an offset register (address 24h) which can be used to implement several functions, such as:

- Accuracy tuning
- Aging adjustment
- Temperature compensation

**Table 23. Offset - offset register (address 24h) bit description**

| Bit    | Symbol      | Value                        | Description  |
|--------|-------------|------------------------------|--------------|
| 7 to 0 | OFFSET[7:0] | see <a href="#">Table 25</a> | offset value |

There are two modes which define the correction period, normal mode and fast mode. The **normal mode** is suitable for offset trimming. The **fast mode** is suitable for dynamic offset correction e.g. implementing a temperature correction. The fast mode consumes more current. Offset mode is defined by bit OFFM in the Oscillator register ([Section 8.10](#)).

**Table 24. OFFM bit - oscillator control register (address 25h)**

See [Section 8.10 on page 42](#).

| Bit | Symbol | Value            | Description   |
|-----|--------|------------------|---|
| 6   | OFFM   |                  | <b>offset mode bit</b>  |
|     |        | 0 <sup>[1]</sup> | normal mode: correction is made every 4 hours; 2.170 ppm/step       |
|     |        | 1                | fast mode: correction is made once every 8 minutes; 2.0345 ppm/step |

[1] Default value.

For OFFM = 0, each LSB introduces an offset of 2.170 ppm. For OFFM = 1, each LSB introduces an offset of 2.0345 ppm. The offset value is coded in two's complement giving a range of +127 LSB to -128 LSB, see [Table 25](#).

**Table 25. Offset values**

| OFFSET[7:0]             | Offset value in decimal | Offset value in ppm     |                       |
|-------------------------|-------------------------|-------------------------|-----------------------|
|                         |                         | Normal mode<br>OFFM = 0 | Fast mode<br>OFFM = 1 |
| 01111111                | +127                    | +275.590                | +258.3815             |
| 01111110                | +126                    | +273.420                | +256.3470             |
| :                       | :                       | :                       | :                     |
| 00000010                | +2                      | +4.340                  | +4.0690               |
| 00000001                | +1                      | +2.170                  | +2.0345               |
| 00000000 <sup>[1]</sup> | 0                       | 0 <sup>[1]</sup>        | 0 <sup>[1]</sup>      |
| 11111111                | -1                      | -2.170                  | -2.0345               |
| 11111110                | -2                      | -4.340                  | -4.0690               |
| :                       | :                       | :                       | :                     |
| 10000001                | -127                    | -275.590                | -258.3815             |
| 10000000                | -128                    | -277.760                | -260.416              |

[1] Default value.

The correction is made by adding or subtracting clock correction pulses, thereby changing the period of a single second but not by changing the oscillator frequency.

It is possible to monitor when correction pulses are applied. See [Section 8.8.4](#).

### 8.8.1 Correction when OFFM = 0

The correction is triggered once every four hours and then correction pulses are applied once per minute until the programmed correction values have been implemented.

**Table 26. Correction pulses for OFFM = 0**

| Correction value | Every n <sup>th</sup> hour | Actual minute  |
|------------------|----------------------------|----------------|
| +1 or -1         | 4                          | 00             |
| +2 or -2         | 4                          | 00 and 01      |
| +3 or -3         | 4                          | 00, 01, and 02 |
| :                | :                          | :              |
| +59 or -59       | 4                          | 00 to 58       |
| +60 or -60       | 4                          | 00 to 59       |
| +61 or -61       | 4                          | 00 to 59       |
|                  | 4 + 1                      | 00             |
| +62 or -62       | 4                          | 00 to 59       |
|                  | 4 + 1                      | 00 and 01      |
| :                | :                          | :              |
| +123 or -123     | 4                          | 00 to 59       |
|                  | 4 + 1                      | 00 to 59       |
|                  | 4 + 2                      | 00, 01, and 02 |
| -128             | 4                          | 00 to 59       |
|                  | 4 + 1                      | 00 to 59       |
|                  | 4 + 2                      | 00 to 07       |

### 8.8.2 Correction when OFFM = 1

The correction is triggered once every eight minutes and then correction pulses are applied once per second until the programmed correction values have been implemented.

Clock correction is made more frequently in OFFM = 1; however, this can result in higher power consumption.

Table 27. Correction pulses for OFFM = 1

| Correction value | Every n <sup>th</sup> minute | Actual second  |
|------------------|------------------------------|----------------|
| +1 or -1         | 8                            | 00             |
| +2 or -2         | 8                            | 00 and 01      |
| +3 or -3         | 8                            | 00, 01, and 02 |
| :                | :                            | :              |
| +59 or -59       | 8                            | 00 to 58       |
| +60 or -60       | 8                            | 00 to 59       |
| +61 or -61       | 8                            | 00 to 59       |
|                  | 8 + 1                        | 00             |
| +62 or -62       | 8                            | 00 to 59       |
|                  | 8 + 1                        | 00 and 01      |
| :                | :                            | :              |
| +123 or -123     | 8                            | 00 to 59       |
|                  | 8 + 1                        | 00 to 59       |
|                  | 8 + 2                        | 00, 01, and 02 |
| -128             | 8                            | 00 to 59       |
|                  | 8 + 1                        | 00 to 59       |
|                  | 8 + 2                        | 00 to 07       |

8.8.3 Offset calibration workflow

The calibration offset has to be calculated based on the time. [Figure 19](#) shows the workflow how the offset register values can be calculated:

Fig 19. Offset calibration calculation workflow

### 8.8.4 Offset interrupts

The generation of interrupts from the offset functions is controlled via the offset interrupt enable bits; OIEA and OIEB. These bits are in registers INTA\_enable (address 29h) and INTB\_enable (address 2Ah).

Every time a correction pulse is made an interrupt pulse can be generated at pins  $\overline{\text{INTA}}$  and  $\overline{\text{INTB}}$ . As there is no offset calibration flag, it is only possible to generate pulse interrupts.

See [Section 8.9 on page 38](#) for interrupt control.

## 8.9 Interrupts

There are two interrupt output pins,  $\overline{\text{INTA}}$  and  $\overline{\text{INTB}}$ . Both pins have the same possible sources and a dedicated register to control what is output. The pins can be used independently from each other.

$\overline{\text{INTA}}$  data is output on the  $\overline{\text{INTA}}$  pin.  $\overline{\text{INTA}}$  is an interrupt output pin with open-drain drive.  $\overline{\text{INTA}}$  pin mode is controlled by INTAPM[1:0] bits in the Pin\_IO register ([Section 8.12 on page 50](#)).

$\overline{\text{INTB}}$  data is output on TS pin with push-pull drive. The TS pin must first be configured as INTB output by setting TSIO[1:0] bits in the Pin\_IO register ([Section 8.12 on page 50](#)).

Interrupts will only be output when the pin mode is correctly defined. Interrupts are output from the IC as active LOW signals.

The registers INTA\_enable (address 29h) and INTB\_enable (address 2Ah) are used to select which interrupts should be output on which pin.

Table 28.  $\overline{\text{INTA}}$  and  $\overline{\text{INTB}}$  interrupt control bits

| Bit  | 7    | 6    | 5    | 4     | 3     | 2      | 1     | 0     |
|--|------|------|------|-------|-------|--------|-------|-------|

| 2   | TSRIEA                   | TSRIEB                   |                  | <b>timestamp register interrupt enable</b> |
|     |                          |                          | 0 <sup>[1]</sup> | no timestamp register interrupt generated  |
|     |                          |                          | 1                | timestamp register interrupt generated     |
| 1   | BSIEA                    | BSIEB                    |                  | <b>battery switch interrupt enable</b>     |
|     |                          |                          | 0 <sup>[1]</sup> | no battery switch interrupt generated      |
|     |                          |                          | 1                | battery switch interrupt generated         |
| 0   | WDIEA                    | WDIEB                    |                  | <b>WatchDog interrupt enable</b>           |
|     |                          |                          | 0 <sup>[1]</sup> | no WatchDog interrupt generated            |
|     |                          |                          | 1                | WatchDog interrupt generated               |

[1] Default value.

### 8.9.1 ILPA/ILPB: interrupt level or pulse mode

Interrupts can be configured to generate a pulse or to send a continuous level (permanent signal) which follows the state of the flag.

In pulse mode, an interrupt pulse is generated every time that the selected source triggers.

Triggered means

- for periodic interrupts, every time a period has elapsed
- for offset correction, every time a correction pulse is initiated
- for alarms, every time the time increments to match the alarm time
- for timestamps, every time a register updates
- for battery switch, every time the IC switches to or from battery
- for WatchDog, every time the counter reaches the end of its count

The interrupt signal goes active coincident with the triggering event. The signal is cleared by an internal 128 Hz clock. The internal clock is asynchronous to the triggering event and so the pulse duration has a minimum period of one 128 Hz cycle and a maximum of two 128 Hz cycles. Interrupt pulses may be shortened by clearing the flag before the end of the pulse period.

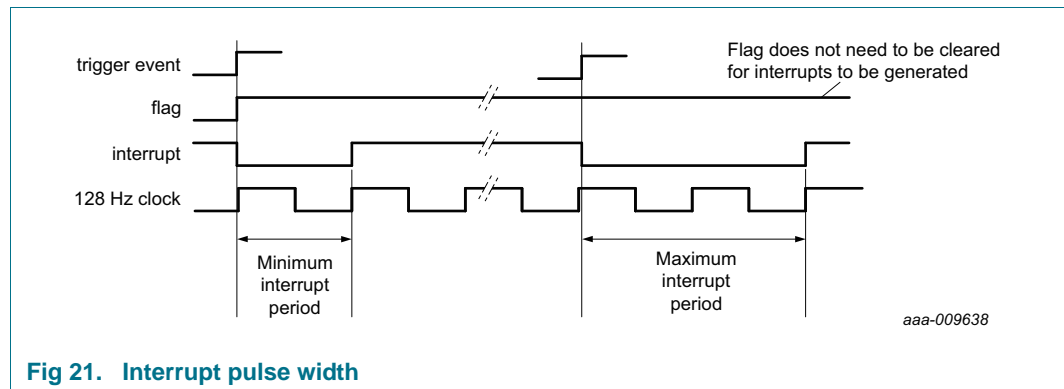

Fig 21. Interrupt pulse width

In level mode, the interrupt signal follows the state of the flag. Only interrupts which are enabled will affect the pin state. All enabled flags must be cleared for the interrupt signal to be cleared.

The EMON is used only for monitoring **all** flags and can be read back in the minutes register. See [Section 8.2.3 on page 15](#).

### 8.9.2 Interrupt enable bits

The remainder of the bits in register INTA\_enable (address 29h) and register INTB\_enable (address 2Ah) are used to select which interrupt data goes where. See [Figure 22 “Interrupt selection”](#)

Fig 22. Interrupt selection

## 8.10 Oscillator register

Table 30. Oscillator - oscillator control register (address 25h) bit description

| Bit     | 7                            | 6                           | 5                              | 4                              | 3                              | 2                              | 1       | 0 |
|---------|------------------------------|-----------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|---------|---|
| Symbol  | CLKIV                        | OFFM                        | 12_24                          | LOWJ                           | OSCD[1:0]                      |                                | CL[1:0] |   |
| Section | <a href="#">Section 8.16</a> | <a href="#">Section 8.8</a> | <a href="#">Section 8.10.3</a> | <a href="#">Section 8.10.4</a> | <a href="#">Section 8.10.5</a> | <a href="#">Section 8.10.6</a> |         |   |

### 8.10.1 CLKIV: invert the clock output

Table 31. CLKIV bit - oscillator control register (address 25h)

| Bit | Symbol | Value            | Description                                      |
|-----|--------|------------------|--|
| 7   | CLKIV  |                  | <b>output clock inversion</b>                    |
|     |        | 0 <sup>[1]</sup> | non-inverting; LOWJ mode will affect rising edge |
|     |        | 1                | inverted; LOWJ mode will affect falling edge     |

[1] Default value.

The clock selected with the COF[2:0] bits (register Function, address 28h) can be inverted. This is intended for use in conjunction with the low jitter mode, LOWJ. The low jitter mode reduces the jitter for the rising edge of the output clock. If the reduced jitter needs to be on the falling edge, for example when using an open-drain clock output, then the CLKIV bit can be used to implement this.

### 8.10.2 OFFM: offset calibration mode

See [Section 8.8 "Offset register" on page 34](#) for a full description of offset calibration.

### 8.10.3 12\_24: 12 hour or 24 hour clock

Table 32. 12\_24 bit - oscillator control register (address 25h)

| Bit | Symbol | Value            | Description                    |
|-----|--------|------------------|--------------------------------|
| 5   | 12_24  |                  | <b>12 hour or 24 hour mode</b> |
|     |        | 0 <sup>[1]</sup> | 24 hour mode is selected       |
|     |        | 1                | 12 hour mode is selected       |

[1] Default value.

In RTC mode, time counting can be configured for 24 hour clock or 12 hour clock with the AMPM flag.

This bit is ignored in stop-watch mode.

### 8.10.4 LOWJ: low jitter mode

Table 33. LOWJ bit - oscillator control register (address 25h)

| Bit | Symbol | Value            | Description   |
|-----|--------|------------------|---|
| 4   | LOWJ   |                  | <b>low jitter CLK output bit</b>                    |
|     |        | 0 <sup>[1]</sup> | normal  |
|     |        | 1                | reduced CLK output jitter; increase I <sub>DD</sub> |

[1] Default value.

Oscillator circuits suffer from jitter. In particular, ultra low-power oscillators like the one used in the PCF85263A are optimized for power and not jitter. By setting the LOWJ bit, the jitter performance can be improved at the cost of power consumption.

### 8.10.5 OSCD[1:0]: quartz oscillator drive control

Table 34. OSCD[1:0] bits - oscillator control register (address 25h)

| Bit    | Symbol    | Value             | Description  |
|--------|-----------|-------------------|--|
| 3 to 2 | OSCD[1:0] |                   | <b>oscillator drive bits</b>                                   |
|        |           | 00 <sup>[1]</sup> | normal drive; $R_{S(max)}$ : 100 k $\Omega$                    |
|        |           | 01                | low drive; $R_{S(max)}$ : 60 k $\Omega$ ; reduced $I_{DD}$     |
|        |           | 10, 11            | high drive; $R_{S(max)}$ : 500 k $\Omega$ ; increased $I_{DD}$ |

[1] Default value.

The oscillator is designed to be used with quartz with a series resistance up to 100 k $\Omega$ . This covers the typical range of 32.768 kHz quartz crystals. Series resistance is also referred to as: ESR, motional resistance, or  $R_S$ .

A low drive mode is available for low series resistance quartz. This reduces the current consumption.

For very high series resistance quartz, there is a high drive mode. Current consumption increases substantially in this mode.

### 8.10.6 CL[1:0]: quartz oscillator load capacitance

Table 35. CL[1:0] bits - oscillator control register (address 25h)

| Bit    | Symbol  | Value             | Description   |
|--------|---------|-------------------|---|
| 1 to 0 | CL[1:0] |                   | <b>internal oscillator capacitor selection</b> for quartz crystals with the corresponding load capacitance of $C_L$ : |
|        |         | 00 <sup>[1]</sup> | 7.0 pF  |
|        |         | 01                | 6.0 pF  |
|        |         | 10                | 12.5 pF   |
|        |         | 11                | 12.5 pF   |

[1] Default value.

$C_L$  refers to the load capacitance of the oscillator circuit and allows for a certain amount of package and PCB parasitic capacitance. When the oscillator circuit matches the  $C_L$  parameter of the quartz, then the frequency offset is zero.

The PCF85263A is designed to operate with quartz with  $C_L$  values of 6.0 pF, 7.0 pF and 12.5 pF.

12.5 pF are generally the cheapest and most widely available, but also require the most power to drive. The circuit also operates with 9.0 pF quartz, however the offset calibration would be needed to compensate. If a 9.0 pF quartz is used, then it is recommended to set  $C_L$  to 7.0 pF.

## 8.11 Battery switch register

This register configures the battery switch-over mode.

Associated with the battery switch-over is the battery switch flag (BSF) in the Flags register ([Section 8.14 on page 57](#)). Whenever the IC switches to battery operation, the flag is set. The flag can only be read when operating from V<sub>DD</sub> power, however an interrupt pulse or static LOW signal can be generated whenever switching to battery. An interrupt pulse can also be generated when switching back to V<sub>DD</sub> power. Examples are given in [Figure 24](#) and [Figure 25](#).

When switched to battery, the V<sub>DD</sub> power domain is disabled. This means that I<sup>2</sup>C pins are ignored, CLK output is disabled and Hi-Z, TS pin output mode is disabled and Hi-Z, TS digital input is ignored and may be left floating. TS pin mechanical switch detector is active. INTA output is still active for interrupt output and battery switch indication, but disabled for clock output.

**Table 36. IO pin behavior in battery mode**

| IO pin (mode)                | V <sub>DD</sub> operation | V <sub>BAT</sub> operation     |
|------------------------------|---------------------------|--------------------------------|
| SCL                          | active input              | disabled; may be left floating |
| SDA                          | active input/output       | disabled; may be left floating |
| CLK                          | active output             | disabled; Hi-Z                 |
| TS (output mode)             | active output             | disabled; Hi-Z                 |
| TS (digital input)           | active input              | disabled; may be left floating |
| TS (mechanical switch input) | active input              | active input                   |
| INTA                         | active output             | active interrupt output        |

**Table 37. Battery\_switch - battery switch control (address 26h) bit description**

| Bit     | 7 | 6 | 5 | 4                              | 3                              | 2                              | 1                              | 0    |
|---------|---|---|---|--------------------------------|--------------------------------|--------------------------------|--------------------------------|------|
| Symbol  | - | - | - | BSOFF                          | BSRR                           | BSM[1:0]                       |                                | BSTH |
| Section | - | - | - | <a href="#">Section 8.11.1</a> | <a href="#">Section 8.11.2</a> | <a href="#">Section 8.11.3</a> | <a href="#">Section 8.11.4</a> |      |

### 8.11.1 BSOFF: battery switch on/off control

**Table 38. BSOFF bit - battery switch control (address 26h) bit description**

| Bit | Symbol | Value            | Description                    |
|-----|--------|------------------|--------------------------------|
| 4   | BSOFF  |                  | <b>battery switch on/off</b>   |
|     |        | 0 <sup>[1]</sup> | enable battery switch feature  |
|     |        | 1                | disable battery switch feature |

[1] Default value.

The battery switch circuit may be disabled when not used. This disables all the circuit and save power consumption. When disabled connect V<sub>BAT</sub> and V<sub>DD</sub> together.

### 8.11.2 BSRR: battery switch internal refresh rate

Table 39. BSRR bit - battery switch control (address 26h) bit description

| Bit | Symbol | Value            | Description                        |
|-----|--------|------------------|------------------------------------|
| 3   | BSRR   |                  | <b>battery switch refresh rate</b> |
|     |        | 0 <sup>[1]</sup> | low                                |
|     |        | 1                | high                               |

[1] Default value.

Non-user bit. Recommended to leave set at default.

### 8.11.3 BSM[1:0]: battery switch mode

Table 40. BSM[1:0] bits - battery switch control (address 26h) bit description

| Bit    | Symbol   | Value             | Description  |
|--------|----------|-------------------|--|
| 2 to 1 | BSM[1:0] |                   | <b>battery switch mode bits</b>                        |
|        |          | 00 <sup>[1]</sup> | switching at the $V_{th}$ level                        |
|        |          | 01                | switching at the $V_{BAT}$ level                       |
|        |          | 10                | switching at the higher level of $V_{th}$ or $V_{BAT}$ |
|        |          | 11                | switching at the lower level of $V_{th}$ or $V_{BAT}$  |

[1] Default value.

Switching is automatic and controlled by the voltages on the VBAT and VDD pins. There are three modes:

- Compare  $V_{DD}$  with an internal reference ( $V_{th}$ )
- Compare  $V_{DD}$  with  $V_{BAT}$
- Compare  $V_{DD}$  with an internal reference ( $V_{th}$ ) and  $V_{BAT}$

The last mode is useful when a rechargeable battery is employed.

Table 41. Battery switch-over modes

| BSM[1:0] | Condition   | Internal power |
|----------|---|----------------|
| 00       | $V_{DD} > V_{th}$   | $V_{DD}$       |
|          | $V_{DD} < V_{th}$   | $V_{BAT}$      |
| 01       | $V_{DD} > V_{BAT}$  | $V_{DD}$       |
|          | $V_{DD} < V_{BAT}$  | $V_{BAT}$      |
| 10       | $V_{DD} > \text{the higher of } V_{th} \text{ or } V_{BAT}$ | $V_{DD}$       |
|          | $V_{DD} < \text{the higher of } V_{th} \text{ or } V_{BAT}$ | $V_{BAT}$      |
| 11       | $V_{DD} > \text{the lower of } V_{th} \text{ or } V_{BAT}$  | $V_{DD}$       |
|          | $V_{DD} < \text{the lower of } V_{th} \text{ or } V_{BAT}$  | $V_{BAT}$      |

Due to the nature of the power switch circuit there is a switching hysteresis (see [Figure 23](#) and [Table 68](#)).

Fig 23. Threshold voltage switching hysteresis

8.11.3.1 Switching at the  $V_{th}$  level, BSM[1:0] = 00

Fig 24. Switching at  $V_{th}$

8.11.3.2 Switching at the V<sub>BAT</sub> level, BSM[1:0] = 01

Fig 25. Switching at V<sub>BAT</sub>

8.11.3.3 Switching at the higher of V<sub>BAT</sub> or V<sub>th</sub> level, BSM[1:0] = 10

With this mode switching takes place when V<sub>DD</sub> falls below the higher of V<sub>th</sub> or V<sub>BAT</sub>. In [Figure 26](#), an example is given where the threshold is set to 1.5 V and a single cell battery is connected to V<sub>BAT</sub>. In this example, switching to the battery voltage takes place when V<sub>DD</sub> falls below V<sub>th</sub>.

Fig 26. Switching at the higher of V<sub>BAT</sub> or V<sub>th</sub>

8.11.3.4 Switching at the lower of V<sub>BAT</sub> and V<sub>th</sub> level, BSM[1:0] = 11

With this mode switching takes place when V<sub>DD</sub> falls below the lower of V<sub>th</sub> or V<sub>BAT</sub>. In Figure 27, an example is given where the threshold is set to 1.5 V and a single cell battery is connected to V<sub>BAT</sub>. In this example, switching to the battery voltage takes place when V<sub>DD</sub> falls below V<sub>BAT</sub>.

Fig 27. Switching at the lower of V<sub>BAT</sub> or V<sub>th</sub>

8.11.4 BSTH: threshold voltage control

Table 42. BSTH - battery switch control (address 26h) bit description

| Bit | Symbol | Value            | Description                                       |
|-----|--------|------------------|---|
| 0   | BSTH   |                  | battery switch threshold voltage, V <sub>th</sub> |
|     |        | 0 <sup>[1]</sup> | V <sub>th</sub> = 1.5 V                           |
|     |        | 1                | V <sub>th</sub> = 2.8 V                           |

[1] Default value.

The threshold for battery switch-over is selectable between two voltages, 1.5 V and 2.8 V.

8.11.5 Battery switch interrupts

The generation of interrupts from the battery switch function is controlled via the battery switch interrupt enable bits; BSIEA and BSIEB. These bits are in registers INTA\_enable (address 29h) and INTB\_enable (address 2Ah).

The assertion of the flag BSF (register Flags, address 2Bh) can be used to generate an interrupt at pins INTA and INTB. The interrupt may be generated as a pulsed signal or alternatively as a permanently active signal which follows the condition of bit BSF. BSF remains set until cleared by command.

When enabled, interrupts are triggered every time the battery switch circuit switches to either battery or to V<sub>DD</sub> and even if the BSF is not cleared, an interrupt pulse can be generated.

In addition, the  $\overline{\text{INTA}}$  pin can be configured as a battery mode indicator (INTAPM[1:0] = 00). See [Section 8.12.6 on page 52](#). This mode differs from a general interrupt signal in that it is only controlled by the current battery switch status.

See [Section 8.9 on page 38](#) for interrupt control.

**Remark:**  $\overline{\text{INTB}}$  pin is only active when the IC is operating from V<sub>DD</sub>.

## 8.12 Pin\_IO register

**Table 43. Pin\_IO- pin input output control register (address 27h) bit description**

| Bit     | 7                              | 6                              | 5                              | 4                              | 3                              | 2                              | 1           | 0                              |
|---------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|-------------|--------------------------------|
| Symbol  | CLKPM                          | TSPULL                         | TSL                            | TSIM                           | TSPM[1:0]                      |                                | INTAPM[1:0] |                                |
| Section | <a href="#">Section 8.12.1</a> | <a href="#">Section 8.12.2</a> | <a href="#">Section 8.12.3</a> | <a href="#">Section 8.12.5</a> | <a href="#">Section 8.12.4</a> | <a href="#">Section 8.12.4</a> |             | <a href="#">Section 8.12.6</a> |

This register is used to define the input and output modes of the IC.

### 8.12.1 CLKPM: CLK pin mode control

**Table 44. CLKPM bit - Pin\_IO control register (address 27h)**

| Bit | Symbol               | Value            | Description         |
|-----|----------------------|------------------|---------------------|
| 7   | CLKPM <sup>[1]</sup> |                  | <b>CLK pin mode</b> |
|     |                      | 0 <sup>[2]</sup> | enable CLK pin      |
|     |                      | 1                | disable CLK pin     |

[1] CLK pin is not available on all package types.

[2] Default value.

Setting the CLKPM bit disables the CLK output and force the pin to drive out a logic 0. Clearing this bit enables the pad to output the selected clock frequency (see bits COF[2:0] in the Function register, see [Table 51 on page 54](#)).

### 8.12.2 TSPULL: TS pin pull-up resistor value

**Table 45. TSPULL bit - Pin\_IO control register (address 27h)**

| Bit | Symbol | Value            | Description                          |
|-----|--------|------------------|--------------------------------------|
| 6   | TSPULL |                  | <b>TS pin pull-up resistor value</b> |
|     |        | 0 <sup>[1]</sup> | 80 kΩ                                |
|     |        | 1                | 40 kΩ                                |

[1] Default value.

Controls the pull-up resistor value used in the mechanical switch detector. For applications where there is a large capacitance on the TS pin e.g. from a long connecting cable to the mechanical switch, the pull-up resistor value can be halved to improve switch detection.

Using the low-resistance value increases current consumption when the switch is closed i.e. shorting to V<sub>SS</sub>.

8.12.3 TSL: TS pin level sense

Table 46. TSL bit - Pin\_IO control register (address 27h)

| Bit | Symbol | Value            | Description               |
|-----|--------|------------------|---------------------------|
| 5   | TSL    |                  | <b>TS pin input sense</b> |
|     |        | 0 <sup>[1]</sup> | active HIGH               |
|     |        | 1                | active LOW                |

[1] Default value.

The active state of the TS pin can be defined for use as a timestamp trigger and/or as stop control for the time counting. Active HIGH implies a transition from logic 0 to logic 1 is active. Active LOW implies a transition from logic 1 to logic 0 is active.

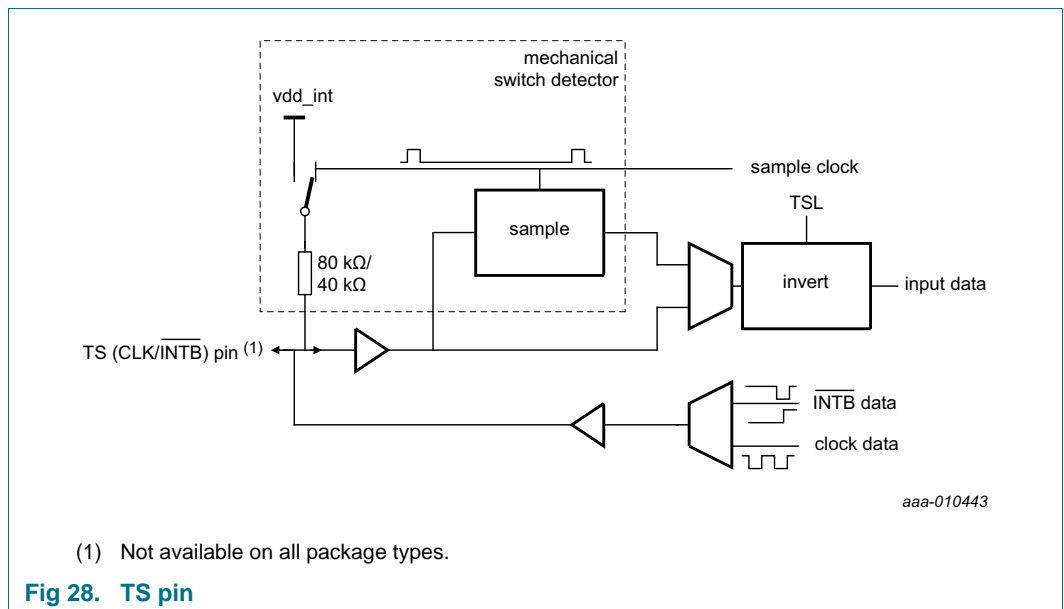

8.12.4 TSPM[1:0]: TS pin I/O control

Table 47. TSPM[1:0] bits - Pin\_IO control register (address 27h)

| Bit    | Symbol    | Value             | Description                          |
|--------|-----------|-------------------|--------------------------------------|
| 3 to 2 | TSPM[1:0] |                   | <b>TS pin IO mode</b>                |
|        |           | 00 <sup>[1]</sup> | disabled; input can be left floating |
|        |           | 01                | INTB output; push-pull               |
|        |           | 10                | CLK output; push-pull                |
|        |           | 11                | input mode                           |

[1] Default value.

These bits control the operation of the TS pin.

TSIM is only considered when the TS pin is in input mode.

8.12.4.1 TS pin output mode; INTB

It is possible to output INTB data on the TS pin. The output is push-pull. No output is available when on V<sub>BAT</sub>. When on V<sub>BAT</sub> the output is Hi-Z.

#### 8.12.4.2 TS pin output mode; CLK

It is possible to output a clock frequency on the TS pin. Clock frequency is selected with the COF[2:0] bits in the Function register ([Section 8.13 on page 54](#)). The output is push-pull. No output is available when on V<sub>BAT</sub>. When on V<sub>BAT</sub> the output is Hi-Z.

#### 8.12.4.3 TS pin disabled

When disabled the pin is Hi-Z and can be left floating.

### 8.12.5 TSIM: TS pin input type control

Table 48. TSIM bit - Pin\_IO control register (address 27h)

| Bit | Symbol | Value            | Description   |
|-----|--------|------------------|---|
| 4   | TSIM   |                  | <b>TS pin input mode</b>  |
|     |        | 0 <sup>[1]</sup> | CMOS input; reference to V <sub>DD</sub> ; disabled when on V <sub>BAT</sub>                              |
|     |        | 1                | mechanical switch mode; active pull-up sampled at 16 Hz; operates on V <sub>DD</sub> and V <sub>BAT</sub> |

[1] Default value.

In CMOS input mode (TSIM = 0), input is taken directly from the TS pin. The input is conditioned by the setting of TSL. When operating on the battery voltage (V<sub>BAT</sub>), the input is disabled and is allowed to float.

In mechanical switch detector mode (TSIM = 1), the TS pin is sampled at a rate of 16 Hz for a period of 30.5 μs. At the same time as the sample a pull-up resistor is activated to detect an open pin or a pin shorted to V<sub>SS</sub>. The input is referenced to the internal power supply. This mode operates when on V<sub>DD</sub> or V<sub>BAT</sub>. The pull-up resistor value can be controlled by TSPULL bit in the Pin\_IO register (see [Section 8.12 on page 50](#)).

#### 8.12.5.1 TS pin input mode

There are two input types which are controlled by the TSIM bit. The TS input can be used to generate a timestamp event by configuring the timestamp mode bits; TSR2M[2:0] and TSR1M[1:0] bits in TSR\_mode register (see [Table 20 on page 30](#)).

Also it is possible to use the TS pin to control counting of time. This is typically for use with the stop-watch mode where an elapsed time counter function can be implemented. Using the STOPM bit in the Function register (see [Table 51 on page 54](#)) it is possible to control the STOP bit by the TS pin.

### 8.12.6 INTAPM[1:0]: $\overline{\text{INTA}}$ pin mode control

Table 49. INTAPM[1:0] bits - Pin\_IO control register (address 27h)

| Bit    | Symbol      | Value             | Description                     |
|--------|-------------|-------------------|---------------------------------|
| 1 to 0 | INTAPM[1:0] |                   | <b>INTA pin mode</b>            |
|        |             | 00 <sup>[1]</sup> | CLK output mode                 |
|        |             | 01                | battery mode indication         |
|        |             | 10                | $\overline{\text{INTA}}$ output |
|        |             | 11                | Hi-Z                            |

[1] Default value.

The  $\overline{\text{INTA}}$  pin can be used to output three different signals.

Fig 29.  $\overline{\text{INTA}}$  pin

**8.12.6.1 INTAPM[1:0]:  $\overline{\text{INTA}}$**

The primary function of the  $\overline{\text{INTA}}$  pin is to output  $\overline{\text{INTA}}$  data.  $\overline{\text{INTA}}$  data is controlled by the bits of the INTA\_enable register (see [Table 29 on page 39](#)).

The output is active LOW with an open-drain output. The output is available during V<sub>DD</sub> and V<sub>BAT</sub> operation.

**8.12.6.2 INTAPM[1:0]: clock data**

It is possible to output a clock frequency on the  $\overline{\text{INTA}}$  pin. Clock frequency is selected with the COF[2:0] bits in the Function register ([Section 8.13 on page 54](#)). The output is active LOW with an open-drain output. The output is available only during V<sub>DD</sub> operation. The output is Hi-Z when operating from V<sub>BAT</sub>.

**Remark:** Clock output is the default state. To save power, it is recommended to disable the clock when not being used. If no clock is required, then set COF[2:0] in the Function register ([Section 8.13 on page 54](#)) to CLK disabled. If clock output is only required on the CLK pin, then set the  $\overline{\text{INTA}}$  pin to either INTA data or battery mode.

**8.12.6.3 INTAPM[1:0]: battery mode indication**

It is possible to output the state of the power switch on the  $\overline{\text{INTA}}$  pin. The output has an open-drain output. The output is available during V<sub>DD</sub> and V<sub>BAT</sub> operation.

Table 50.  $\overline{\text{INTA}}$  battery mode

| Power supply     | $\overline{\text{INTA}}$ pin state |
|------------------|------------------------------------|
| V <sub>DD</sub>  | $\overline{\text{INTA}}$ = Hi-Z    |
| V <sub>BAT</sub> | $\overline{\text{INTA}}$ = logic 0 |

### 8.13 Function register

Table 51. Function - chip function control register (address 28h) bit description

| Bit     | 7                              | 6                              | 5                              | 4                              | 3                              | 2                              | 1 | 0 |
|---------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|---|---|
| Symbol  | 100TH                          | PI[1:0]                        |                                | RTCM                           | STOPM                          | COF[2:0]                       |   |   |
| Section | <a href="#">Section 8.13.1</a> | <a href="#">Section 8.13.2</a> | <a href="#">Section 8.13.3</a> | <a href="#">Section 8.13.3</a> | <a href="#">Section 8.13.4</a> | <a href="#">Section 8.13.5</a> |   |   |

#### 8.13.1 100TH: 100th seconds mode

Table 52. 100TH bit - Function control register (address 28h)

| Bit | Symbol | Value            | Description              |
|-----|--------|------------------|--------------------------|
| 7   | 100TH  |                  | <b>100th second mode</b> |
|     |        | 0 <sup>[1]</sup> | 100th second disabled    |
|     |        | 1                | 100th second enabled     |

[1] Default value.

The PCF85263A can be configured to count at a resolution of 1 second or 0.01 seconds. In 100th mode, the 100th\_seconds register becomes available and the RTC counts at a resolution of 0.01 seconds.

The 256 Hz clock signal is divided by 3 for fourteen 100 Hz periods and then by 2 for eleven 100 Hz periods. This produces an effective division ratio of 2.56 with a maximum jitter of 3.91 ms. Over twenty-five 100 Hz cycles the jitter is 0 ns.

#### 8.13.2 PI[1:0]: Periodic interrupt

Table 53. PI[1:0] bits - Function control register (address 28h)

| Bit    | Symbol  | Value             | Description               |
|--------|---------|-------------------|---------------------------|
| 6 to 5 | PI[1:0] |                   | <b>periodic interrupt</b> |
|        |         | 00 <sup>[1]</sup> | no periodic interrupt     |
|        |         | 01                | once per second           |
|        |         | 10                | once per minute           |
|        |         | 11                | once per hour             |

[1] Default value.

The periodic interrupt mode can be used to enable pre-defined timers for generating pulses on the interrupt pin. Interrupts once per second, once per minute or once per hour can be generated.

When disabled, the timers are reset. When enabled, the time to the first pulse is between the chosen period and the chosen period minus 1 seconds.

The timers are not affected by STOP.

When the periodic interrupt triggers, the PIF (PI flag) in the Flags register ([Section 8.14 on page 57](#)) is set.

The flag does not have to be cleared to allow another  $\overline{\text{INTA}}$  or  $\overline{\text{INTB}}$  pulse.

The duration of the periodic interrupt is unaffected by offset calibration.

See [Section 8.9 “Interrupts”](#) for a description of interrupt pulse control and output pins.

### 8.13.3 RTCM: RTC mode

Table 54. RTCM bit - Function control register (address 28h)

| Bit | Symbol | Value            | Description          |
|-----|--------|------------------|----------------------|
| 4   | RTCM   |                  | <b>RTC mode</b>      |
|     |        | 0 <sup>[1]</sup> | real-time clock mode |
|     |        | 1                | stop-watch mode      |

[1] Default value.

The RTC mode is used to control how the time is counted. When configured as a classic RTC, then time is counted from 100th seconds to years. In stop-watch mode, time is counted from 100th seconds to 999999 hours.

Table 55. RTC time counting modes

| RTCM | Mode       | Time counting   |
|------|------------|---|
| 0    | RTC        | 100th seconds <sup>[1]</sup> , seconds, minutes, hours, days, weekdays, months, years |
| 1    | stop-watch | 100th seconds <sup>[1]</sup> , seconds, minutes, hours (0 hours to 999999 hours)      |

[1] Enabled with 100TH bit in the Function register ([Section 8.13 on page 54](#)).

### 8.13.4 STOPM: STOP mode control

Table 56. STOPM bit - Function control register (address 28h)

| Bit | Symbol | Value            | Description                                  |
|-----|--------|------------------|--|
| 3   | STOPM  |                  | <b>STOP mode</b>                             |
|     |        | 0 <sup>[1]</sup> | RTC stop is controlled by STOP bit only      |
|     |        | 1                | RTC stop is controlled by STOP bit or TS pin |

[1] Default value.

The STOP register bit in the Oscillator register ([Section 8.10 on page 42](#)) is used to stop the counting of time in both RTC mode and stop-watch mode. Stopping of the oscillator can also be controlled from the TS pin. The TS pin must first be configured as an input by the TSPM[1:0] bits, then selected for active HIGH or active LOW by the TSL bits.

Table 57. Oscillator stop control when STOPM = 1

| STOP bit <sup>[1]</sup> | TSL | TS pin <sup>[2]</sup> | Oscillator state | Description        |
|-------------------------|-----|-----------------------|------------------|--------------------|
| 0                       | 0   | 0                     | running          | TS pin active HIGH |
|                         |     | 1                     | stopped          |                    |
|                         | 1   | 0                     | stopped          | TS pin active LOW  |
|                         |     | 1                     | running          |                    |
| 1                       | -   | -                     | stopped          | TS pin ignored     |

[1] In the Oscillator register ([Section 8.10 on page 42](#)).

[2] TSPM[1:0] = 11.

### 8.13.5 COF[2:0]: Clock output frequency

Table 58. COF[2:0] bits - Function control register (address 28h)

| Bit    | Symbol   | Value              | Frequency selection (Hz) |            |          |
|--------|----------|--------------------|--------------------------|------------|----------|
|        |          |                    | CLK pin                  | TS pin     | INTA pin |
| 2 to 0 | COF[2:0] | 000 <sup>[1]</sup> | 32768                    | 32768      | 32768    |
|        |          | 001                | 16384                    | 16384      | 16384    |
|        |          | 010                | 8192                     | 8192       | 8192     |
|        |          | 011                | 4096                     | 4096       | 4096     |
|        |          | 100                | 2048                     | 2048       | 2048     |
|        |          | 101                | 1024                     | 1024       | 1024     |
|        |          | 110                | 1                        | 1          | 1        |
|        |          | 111                | static LOW               | static LOW | Hi-Z     |

[1] Default value.

A programmable square wave is available at pin CLK. Operation is controlled by the COF[2:0] bits. Frequencies of 32.768 kHz (default) down to 1 Hz can be generated for use as a system clock, microcontroller clock, input to a charge pump, or for calibration of the oscillator.

Pin CLK is a push-pull output and enabled at power-on. Pin CLK can be disabled by setting CLKPM = 1 in the Pin\_IO register ([Section 8.12 on page 50](#)). When disabled, the CLK pin is LOW.

The selected clock frequency may also be output on the TS pin and the INTA pin. The CLKIV bit may be used to invert the clock output. CLKIV does not invert for the setting COF[2:0] = 111.

The duty cycle of the selected clock is not controlled. However, due to the nature of the clock generation, all clock frequencies except 32.768 kHz have a duty cycle of 50 : 50.

Table 59. Clock duty cycles

| COF[2:0]           | Frequency (Hz)   | Typical duty cycle <sup>[1]</sup> |
|--------------------|------------------|-----------------------------------|
| 000 <sup>[2]</sup> | 32768            | 60 : 40 to 40 : 60                |
| 001                | 16384            | 50 : 50                           |
| 010                | 8192             | 50 : 50                           |
| 011                | 4096             | 50 : 50                           |
| 100                | 2048             | 50 : 50                           |
| 101                | 1024             | 50 : 50                           |
| 110                | 1 <sup>[3]</sup> | 50 : 50                           |
| 111                | static           | -                                 |

[1] Duty cycle definition: % HIGH-level time : % LOW-level time.

[2] Default values. The duty cycle of the CLKOUT when outputting 32,768 Hz could change from 60:40 to 40:60 depending on the detector since the 32,768 Hz is derived from the oscillator output which is not perfect. It could change from device to device and it depends on the silicon diffusion. There is nothing that can be done from outside the chip to influence the duty cycle.

[3] 1 Hz clock pulses are not affected by offset correction pulses.

## 8.14 Flags register

Table 60. Flags - Flag status register (address 2Bh) bit description

| Bit | Symbol              | Flag name   | Value            | Description  |
|-----|---------------------|---|------------------|--|
| 7   | PIF                 | Periodic Interrupt Flag<br><a href="#">Section 8.13.2 on page 54</a>      | 0 <sup>[1]</sup> | read: periodic interrupt flag inactive<br>write: periodic interrupt flag is cleared          |
|     |                     |   | 1                | read: periodic interrupt flag active<br>write: periodic interrupt flag remains unchanged     |
| 6   | A2F                 | Alarm2 Flag<br><a href="#">Section 8.4 on page 19</a>                     | 0 <sup>[1]</sup> | read: alarm2 flag inactive<br>write: alarm2 flag is cleared                                  |

[1] Default value.

The flags are set by their respective function. A full description can be found there. All flags behave the same way. They are set by some function of the IC and remain set until overwritten by command. It is possible to clear flags individually. To prevent one flag being overwritten while clearing another, a logic AND is performed during a write access. All flags are combined to generate an event monitoring signal called EMON. EMON is described in [Section 8.2.3 on page 15](#) and can be read as the MSB of minutes register.

### 8.15 Reset register

Table 61. Reset - software reset control (address 2Fh) bit description

| Bit     | 7                              | 6 | 5 | 4 | 3                              | 2 | 1 | 0                              |
|---------|--------------------------------|---|---|---|--------------------------------|---|---|--------------------------------|
| Symbol  | CPR                            | 0 | 1 | 0 | SR                             | 1 | 0 | CTS                            |
| Section | <a href="#">Section 8.15.2</a> |   |   |   | <a href="#">Section 8.15.1</a> |   |   | <a href="#">Section 8.15.3</a> |

For a

- software reset (SR), 00101100 (2Ch) must be sent to register Reset (address 2Fh). A software reset also triggers CPR and CTS
- clear prescaler (CPR), 10100100 (A4h) must be sent to register Reset (address 2Fh)
- clear timestamp (CTS), 00100101 (25h) must be sent to register Reset (address 2Fh)

It is possible to combine CPR and CTS by sending 10100101 (A5h).

**Remark:** Any other value sent to this register is ignored.

#### 8.15.1 SR - Software reset

A reset is automatically generated at power-on. A reset can also be initiated with the software reset command.

Fig 30. Software reset command

The PCF85263A resets to:

- Mode** — real-time clock, 100th second off
- Time** — 00:00:00.00
- Date** — 2000.01.01
- Weekday** — Saturday
- Battery switch** — on, switching on the lower threshold voltage
- Oscillator** — C<sub>L</sub> = 7 pF
- Pins** —  $\overline{\text{INTA}}$  = 32 kHz output, CLK = 32 kHz output, TS = disabled

In the reset state, all registers are set according to [Table 62](#).

**Table 62. Registers reset values**  
Registers labeled as - remain unchanged.

| Address    | Register name    | Bit |   |   |   |   |   |   |   |
|------------|------------------|-----|---|---|---|---|---|---|---|
|            |                  | 7   | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| 00h        | 100TH_seconds    | 0   | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 01h        | Seconds          | 1   | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 02h        | Minutes          | 0   | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 03h        | Hours            | 0   | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 04h        | Days             | 0   | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| 05h        | Weekdays         | 0   | 0 | 0 | 0 | 0 | 1 | 1 | 0 |
| 06h        | Months           | 0   | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

| 2Fh     | Reset         | 0   | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

### 8.15.2 CPR: clear prescaler

To set the time for RTC mode accurately or to clear the time in stop-watch mode, the clear prescaler instruction is needed.

Before sending this instruction, it is recommended to first set *stop* either by the STOP bit or by the TS pin (see STOPM bit).

See STOP definition for an explanation on using this instruction.

### 8.15.3 CTS: clear timestamp

The timestamp registers (address 11h to 22h) can be set to all 0 with this instruction.

## 8.16 Stop\_enable register

**Table 63. Stop\_enable - control of STOP bit (address 2Eh)**

| Bit    | Symbol | Value            | Description          |
|--------|--------|------------------|----------------------|
| 7 to 1 | -      | 0000000          | not used             |
| 0      | STOP   |                  | <b>STOP bit</b>      |
|        |        | 0 <sup>[1]</sup> | RTC clock runs       |
|        |        | 1                | RTC clock is stopped |

[1] Default value.

The STOP bit stops the time from counting in both RTC mode and stop-watch mode. For RTC mode STOP is useful to set the time accurately. For stop-watch mode it is the start/stop control for the watch.

The counter can also be controlled from the TS pin by configuring STOPM in the Function register ([Section 8.13 on page 54](#)). The internal *stop* signal is a combination of STOP and the TS pin state.

**Table 64. Counter stop signal**

| STOP bit | TS pin <sup>[1][2]</sup> | stop signal | Counter |
|----------|--------------------------|-------------|---------|
| 1        | -                        | 1           | stopped |
| -        | 1                        | 1           | stopped |
| 0        | 0                        | 0           | running |

[1] Requires STOPM and TSPM[1:0] to be configured.

[2] TSL = 0 (active HIGH) (Pin\_IO register, address 27h).

The *stop* signal blocks the 8.192 kHz clock from generating system clocks and freezes the time. In this state, the prescaler can be cleared with the CPR command in the Resets register (Section 8.15 on page 58).

**Remark:** The output of clock frequencies is not affected.

The time circuits can then be set and do not increment until the STOP bit is released.

The *stop* acts on the 8.192 kHz signal. And because the I<sup>2</sup>C-bus or TS pin input is asynchronous to the crystal oscillator, the accuracy of restarting the time circuits is between zero and one 8.192 kHz cycle (see Figure 32).

The first increment of the time circuits is between 0 s and 122 μs after STOP is released.

The flow for accurately setting the time in RTC mode is:

- start an I<sup>2</sup>C access at register 2Eh
- set STOP bit
- send CPR instruction
- address counter rolls over to address 00h
- set time (100th seconds, seconds to years)
- end I<sup>2</sup>C access
- wait for external time reference to indicate that time counting should start
- start an I<sup>2</sup>C access at register 2Eh
- clear STOP bit (time starts counting from now)

- end I<sup>2</sup>C access

The flow for resetting time in stop-watch mode is:

- start an I<sup>2</sup>C access at register 2Eh
- set STOP bit
- send CPR instruction
- address counter will roll over to address 00h
- set time to 000000:00:00.00
- end I<sup>2</sup>C access

## 9. I<sup>2</sup>C-bus interface

The I<sup>2</sup>C-bus is for bidirectional, two-line communication between different ICs. The two lines are a Serial DATA line (SDA) and a Serial CLOCK line (SCL). Both lines must be connected to a positive supply via a pull-up resistor. Data transfer may be initiated only when the bus is not busy. Both data and clock lines remain HIGH when the bus is not busy. The PCF85263A acts as a slave receiver when being written to and as a slave transmitter when being read from.

**Remark:** When on V<sub>BAT</sub> power, the interface is not accessible.

Fig 33. I<sup>2</sup>C read and write protocol

Fig 34. I<sup>2</sup>C read and write signaling

### 9.1 Bit transfer

One data bit is transferred during each clock pulse. The data on the SDA line must remain stable during the HIGH period of the clock pulse, as changes in the data line at this time are interpreted as STOP or START conditions.

## 9.2 START and STOP conditions

A HIGH-to-LOW transition of the data line while the clock is HIGH is defined as the START condition - S.

A LOW-to-HIGH transition of the data line while the clock is HIGH is defined as the STOP condition - P (see [Figure 34](#)).

## 9.3 Acknowledge

Each byte of 8 bits is followed by an acknowledge cycle. An acknowledge is defined as logic 0. A not-acknowledge is defined as logic 1.

When written to, the slave will generate an acknowledge after the reception of each byte. After the acknowledge, another byte may be transmitted. It is also possible to send a STOP or START condition.

When read from, the master receiver must generate an acknowledge after the reception of each byte. When the master receiver no longer requires bytes to be transmitter, it must generate a not-acknowledge. After the not-acknowledge, either a STOP or START condition must be sent.

A detailed description of the I<sup>2</sup>C-bus specification is given in [Ref. 14 "UM10204"](#).

## 10. Interface protocol

The PCF85263A uses the I<sup>2</sup>C interface for data transfer. Interpretation of the data is determined by the interface protocol.

### 10.1 Write protocol

After the I<sup>2</sup>C slave address is transmitted, the PCF85263A requires that the register address pointer is defined. It can take the value 00h to 2Fh. Values outside of that range will result in the transfer being ignored, however the slave will still respond with acknowledge pulses.

After the register address is transmitted, write data is transmitted. The minimum number of data write bytes is 0 and the maximum number is unlimited. After each write, the address pointer increments by one. After address 2Fh, the address pointer will roll over to 00h.

- I<sup>2</sup>C START condition
- I<sup>2</sup>C slave address + write
- register address
- write data
- write data
- :
- write data
- I<sup>2</sup>C STOP condition; an I<sup>2</sup>C RE-START condition is also possible.

### 10.2 Read protocol

When reading the PCF85263A, reading starts at the current position of the address pointer. The address pointer for read data should first be defined by a write sequence.

- I<sup>2</sup>C START condition
- I<sup>2</sup>C slave address + write
- register address
- I<sup>2</sup>C STOP condition; an I<sup>2</sup>C RE-START condition is also possible.

After setting the address pointer, a read can be executed. After the I<sup>2</sup>C slave address is transmitted, the PCF85263A will immediately output read data. After each read, the address pointer increments by one. After address 2Fh, the address pointer will roll over to 00h.

- I<sup>2</sup>C START condition
- I<sup>2</sup>C slave address + read
- read data (master sends acknowledge bit)
- read data (master sends acknowledge bit)
- :
- read data (master sends **not**-acknowledge bit)
- I<sup>2</sup>C STOP condition. An I<sup>2</sup>C RE-START condition is also possible.

The master must indicate that the last byte has been read by generating a not-acknowledge after the last read byte.

### 10.3 Slave addressing

#### 10.3.1 Slave address

One I<sup>2</sup>C-bus slave address (1010 001) is reserved for the PCF85263A. The entire I<sup>2</sup>C-bus slave address byte is shown in [Table 65](#).

**Table 65. I<sup>2</sup>C slave address byte**

| Bit | Slave address |   |   |   |   |   |   |     |
|-----|---------------|---|---|---|---|---|---|-----|
|     | 7             | 6 | 5 | 4 | 3 | 2 | 1 | 0   |
|     | MSB           |   |   |   |   |   |   | LSB |
|     | 1             | 0 | 1 | 0 | 0 | 0 | 1 | R/W |

After a START condition, the I<sup>2</sup>C slave address has to be sent to the PCF85263A device.

Slave address can also be written in a hexadecimal format:

- A2h - Write slave address
- A3h - Read slave address

## 11. Application design-in information

In this application, stop-watch mode is used to implement an elapsed time counter. The TS pin is used with a mechanical switch to start and stop the time. Each time the time is stopped, timestamp2 is loaded with the current time and an interrupt is generated on the INTA pin.

Fig 35. Application example

The RTC must be configured correctly for this mode of operation. Outlined in [Table 66](#) are the settings needed for this mode.

In addition, the time must be set and any other configurations like battery switch-over, quartz oscillator driving mode, etc., which are dependent on the application.

The sampler circuit shown in [Figure 35](#) will hold invalid data until the mechanical switch detector mode is enabled. It then requires a minimum of one sample period to initialize to the current TS pin level. It is recommended to enable the mechanical detector mode on the TS pin at least 62.5 ms before enabling the TS event mode. Failure to do so can result in a false first event.

Table 66. Application configuration

| Register | Section                      | Bit(s)      | State | Comment                                      |
|----------|------------------------------|-------------|-------|--|
| Pin_IO   | <a href="#">Section 8.12</a> | TSPM[1:0]   | 11    | TS pin in input mode                         |

| Pin_IO   | <a href="#">Section 8.12</a> | TSL         | 1     | TS pin input is active LOW                   |
| Function | <a href="#">Section 8.13</a> | STOPM       | 1     | allow TS pin to control STOP                 |
|          |                              | TSRIEA      | 1     | allow timestamps to create interrupts        |
|          |                              | ILPA        | 0     | generate interrupt pulses                    |
| TSR_mode | <a href="#">Section 8.12</a> | TSR2M[2:0]  | 101   | last event mode for timestamp2               |
| Pin_IO   | <a href="#">Section 8.12</a> | INTAPM[1:0] | 10    | output interrupt on $\overline{\text{INTA}}$ |

Figure 36 shows the waveforms that can be expected. *sample clock*, *vdd\_int* and *stop* are internal nodes. *vdd\_int* is the supply which operates the IC and will be either  $V_{DD}$  or  $V_{BAT}$ , depending on the state of the battery switch-over.

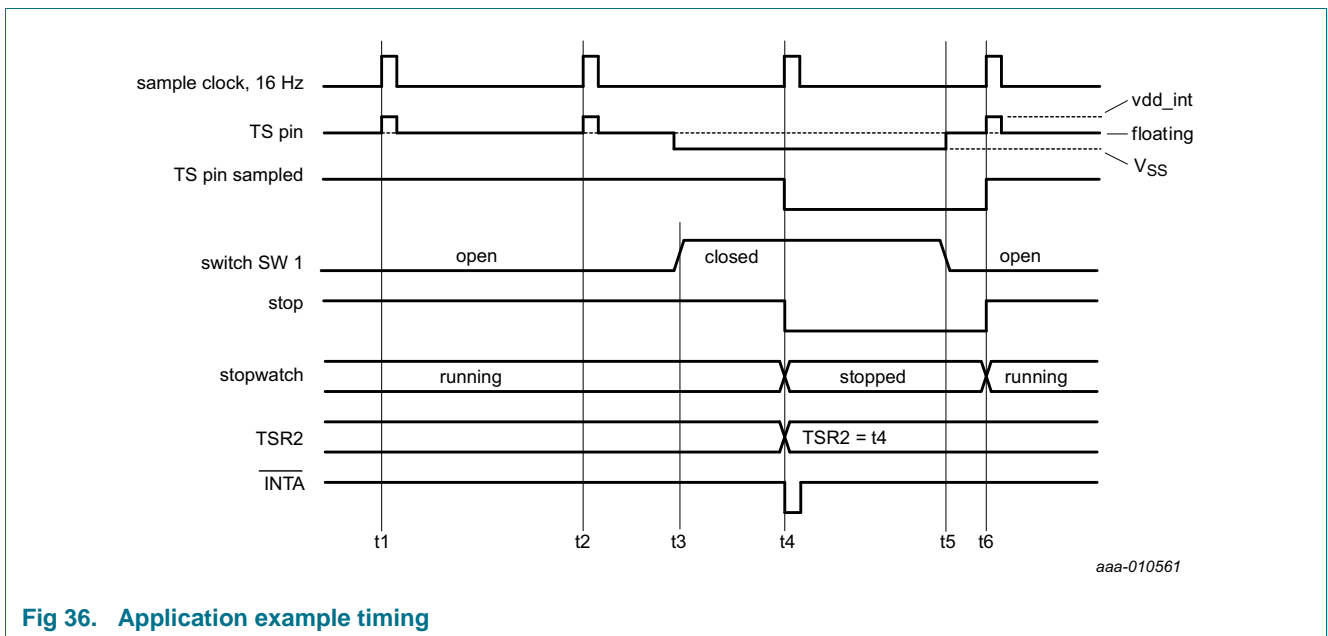

Fig 36. Application example timing

- At and before t1, SW1 is open (TS pin floating). The TS pin is sampled and the internal pull-up resistor will pull the pin HIGH to *vdd\_int*. No actions are taken by the IC.
- At t2, SW1 is still open. No action is taken by the IC.
- At t3, SW1 closes. The TS pin is now shorted to  $V_{SS}$ . The TS pin has not been sampled yet, so no action is taken by the IC.
- At t4, SW1 is closed. The internal pull-up resistor is enabled, but TS pin remains LOW. The pin is then sampled and the LOW level detected. As the TSL bit was set for active LOW detection, the HIGH-LOW transition of TS pin sampled triggers an event. STOPM mode was configured to allow the TS pin to stop the time counting. As the TSL bit was set for active LOW, time counting stops when the TS pin is LOW. Timestamp register 2 was configured to take a copy of the time on an event of the TS pin, hence TSR2 loads the time t4. TSR2F is also set.

$\overline{\text{INTA}}$  was configured to generate an interrupt when TSR2 loads a new time, hence an interrupt pulse is seen on  $\overline{\text{INTA}}$ .

- At t5, SW1 is opened. No action is taken by the IC.
- At t6, SW1 is open. The internal pull-up is active and the TS pin raises to *vdd\_int* level. The HIGH level is sampled and causes the *stop* signal to be released and time starts counting again.

## 12. Internal circuitry

## 13. Safety notes

### CAUTION

This device is sensitive to ElectroStatic Discharge (ESD). Observe precautions for handling electrostatic sensitive devices.

Such precautions are described in the *ANSI/ESD S20.20*, *IEC/ST 61340-5*, *JESD625-A* or equivalent standards.

## 14. Limiting values

**Table 67. Limiting values**

In accordance with the Absolute Maximum Rating System (IEC 60134).

| Symbol           | Parameter                       | Conditions                 | Min                 | Max   | Unit |

- [1] For reliable oscillator start-up at power-on use  $V_{DD}$  greater than 1.2 V. If powered up at 0.9 V the oscillator will start but it might be a bit slow, especially if at high temperature. Normally the power supply is not 0.9 V at start-up and only comes at the end of battery discharge.  $V_{DD}$  min of 0.9 V is specified so that the customer can calculate how large a battery or capacitor they need for their application.  $V_{DD}$  min of 1.2 V or greater is needed to ensure speedy oscillator start-up time.
- [2] 400 kHz I2C operation is production tested at 1.8 V. Design methodology allows I2C operation at 1.8 V – 5 % (1.71 V) which has been verified during product characterization on a limited number of devices.
- [3] Measured after reset and CLK disabled, level of inputs is  $V_{DD}$  or  $V_{SS}$ .
- [4] Measured after reset, CLK disabled, battery switch disabled and level of inputs is  $V_{DD}$  or  $V_{SS}$ .
- [5] The I<sup>2</sup>C-bus interface of PCF85263A is 5 V tolerant.
- [6] Implicit by design.
- [7] See [Table 45 on page 50](#).
- [8] See [Table 33 on page 42](#).
- [9] Integrated load capacitance,  $C_{L(itg)}$ , is a calculation of  $C_{OSCI}$  and  $C_{OSCO}$  in series:  $C_{L(itg)} = \frac{(C_{OSCI} \cdot C_{OSCO})}{(C_{OSCI} + C_{OSCO})}$ .
- [10] See [Table 34 on page 43](#).

T<sub>amb</sub> = 25 °C; f<sub>CLKOUT</sub> = 32768 Hz.

- (1) 47 pF CLKOUT load.
- (2) 22 pF CLKOUT load.
- (3) 0 pF CLKOUT load.

T<sub>amb</sub> = 25 °C; CLKOUT disabled.

- (1) C<sub>L(itg)</sub> = 12.5 pF.
- (2) C<sub>L(itg)</sub> = 7 pF.
- (3) C<sub>L(itg)</sub> = 6 pF.

**Fig 40. Typical I<sub>DD</sub> with respect to V<sub>DD</sub>**

**Table 69. I<sup>2</sup>C-bus characteristics**

$V_{DD} = 1.8\text{ V to }5.5\text{ V}$ ;  $V_{SS} = 0\text{ V}$ ;  $T_{amb} = -40\text{ }^{\circ}\text{C to }+85\text{ }^{\circ}\text{C}$ ;  $f_{osc} = 32.768\text{ kHz}$ ; quartz  $R_s = 60\text{ k}\Omega$ ;  $C_L = 7\text{ pF}$ ; unless otherwise specified. All timing values are valid within the operating supply voltage and temperature range and referenced to  $V_{IL}$  and  $V_{IH}$  with an input voltage swing of  $V_{SS}$  to  $V_{DD}$ [1].

| Symbol       | Parameter   | Conditions | Min                                 | Max | Unit          |
|--------------|---|------------|-------------------------------------|-----|---------------|
| $C_b$        | capacitive load for each bus line                                 |            | -                                   | 400 | pF            |
| $f_{SCL}$    | SCL clock frequency   | [2]        | 0                                   | 400 | kHz           |
| $t_{HD;STA}$ | hold time (repeated) START condition                              |            | 0.6                                 | -   | $\mu\text{s}$ |
| $t_{SU;STA}$ | set-up time for a repeated START condition                        |            | 0.6                                 | -   | $\mu\text{s}$ |
| $t_{LOW}$    | LOW period of the SCL clock                                       |            | 1.3                                 | -   | $\mu\text{s}$ |
| $t_{HIGH}$   | HIGH period of the SCL clock                                      |            | 0.6                                 | -   | $\mu\text{s}$ |
| $t_r$        | rise time of both SDA and SCL signals                             |            | 20                                  | 300 | ns            |
| $t_f$        | fall time of both SDA and SCL signals                             | [3][4]     | $20 \times (V_{DD} / 5.5\text{ V})$ | 300 | ns            |
| $t_{BUF}$    | bus free time between a STOP and START condition                  |            | 1.3                                 | -   | $\mu\text{s}$ |
| $t_{SU;DAT}$ | data set-up time  |            | 100                                 | -   | ns            |
| $t_{HD;DAT}$ | data hold time  |            | 0                                   | -   | ns            |
| $t_{SU;STO}$ | set-up time for STOP condition                                    |            | 0.6                                 | -   | $\mu\text{s}$ |
| $t_{VD;DAT}$ | data valid time   |            | 0                                   | 0.9 | $\mu\text{s}$ |
| $t_{VD;ACK}$ | data valid acknowledge time                                       |            | 0                                   | 0.9 | $\mu\text{s}$ |
| $t_{SP}$     | pulse width of spikes that must be suppressed by the input filter |            | 0                                   | 50  | ns            |

- [1] A detailed description of the I<sup>2</sup>C-bus specification is given in [Ref. 14 "UM10204"](#).
- [2] I<sup>2</sup>C-bus access time between two STARTs or between a START and a STOP condition to this device must be less than one second.
- [3] A device must internally provide a hold time of at least 300 ns for the SDA signal (with respect to the  $V_{IH(\min)}$  of the SCL signal) to bridge the undefined region of the falling edge of SCL.
- [4] The maximum  $t_f$  for the SDA and SCL bus lines is specified at 300 ns. The maximum fall time for the SDA output stage  $t_f$  is specified at 250 ns. This allows series protection resistors to be connected in between the SDA and the SCL pins and the SDA/SCL bus lines without exceeding the maximum specified  $t_f$ .

## 16. Application information

The data sheet values were obtained using a crystal with an ESR of 60 kΩ. If a crystal with an ESR of 70 kΩ is used then the power consumption would increase by a few nA and the start-up time will increase slightly.

## 17. Test information

### 17.1 Quality information

#### UL Component Recognition

This (component or material) is Recognized by UL. Representative samples of this component have been evaluated by UL and meet applicable UL requirements.

### 18. Package outline

SO8: plastic small outline package; 8 leads; body width 3.9 mm

SOT96-1

Fig 44. Package outline SOT96-1 (SO8), PCF85263AT

DFN2626-10: plastic thermal enhanced extremely thin small outline package; no leads;  
10 terminals; body 2.6 x 2.6 x 0.5 mm

SOT1197-1

## 19. Handling information

---

All input and output pins are protected against ElectroStatic Discharge (ESD) under normal handling. When handling Metal-Oxide Semiconductor (MOS) devices ensure that all normal precautions are taken as described in *JESD625-A*, *IEC 61340-5* or equivalent standards.

## 20. Packing information

---

For tape and reel packing information, please see:

- [Ref. 10 "SOT96-1\\_118"](#)
- [Ref. 11 "SOT505-1\\_118"](#)
- [Ref. 12 "SOT552-1\\_118"](#)
- [Ref. 13 "SOT1197-1\\_115"](#)

## 21. Soldering of SMD packages

---

This text provides a very brief insight into a complex technology. A more in-depth account of soldering ICs can be found in Application Note *AN10365 "Surface mount reflow soldering description"*.

### 21.1 Introduction to soldering

Soldering is one of the most common methods through which packages are attached to Printed Circuit Boards (PCBs), to form electrical circuits. The soldered joint provides both the mechanical and the electrical connection. There is no single soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and Surface Mount Devices (SMDs) are mixed on one printed wiring board; however, it is not suitable for fine pitch SMDs. Reflow soldering is ideal for the small pitches and high densities that come with increased miniaturization.

### 21.2 Wave and reflow soldering

Wave soldering is a joining technology in which the joints are made by solder coming from a standing wave of liquid solder. The wave soldering process is suitable for the following:

- Through-hole components
- Leaded or leadless SMDs, which are glued to the surface of the printed circuit board

Not all SMDs can be wave soldered. Packages with solder balls, and some leadless packages which have solder lands underneath the body, cannot be wave soldered. Also, leaded SMDs with leads having a pitch smaller than ~0.6 mm cannot be wave soldered, due to an increased probability of bridging.

The reflow soldering process involves applying solder paste to a board, followed by component placement and exposure to a temperature profile. Leaded packages, packages with solder balls, and leadless packages are all reflow solderable.

Key characteristics in both wave and reflow soldering are:

- Board specifications, including the board finish, solder masks and vias
- Package footprints, including solder thieves and orientation
- The moisture sensitivity level of the packages
- Package placement
- Inspection and repair
- Lead-free soldering versus SnPb soldering

**21.3 Wave soldering**

Key characteristics in wave soldering are:

- Process issues, such as application of adhesive and flux, clinching of leads, board transport, the solder wave parameters, and the time during which components are exposed to the wave
- Solder bath specifications, including temperature and impurities

**21.4 Reflow soldering**

Key characteristics in reflow soldering are:

- Lead-free versus SnPb soldering; note that a lead-free reflow process usually leads to higher minimum peak temperatures (see [Figure 48](#)) than a SnPb process, thus reducing the process window
- Solder paste printing issues including smearing, release, and adjusting the process window for a mix of large and small components on one board
- Reflow temperature profile; this profile includes preheat, reflow (in which the board is heated to the peak temperature) and cooling down. It is imperative that the peak temperature is high enough for the solder to make reliable solder joints (a solder paste characteristic). In addition, the peak temperature must be low enough that the packages and/or boards are not damaged. The peak temperature of the package depends on package thickness and volume and is classified in accordance with [Table 70](#) and [71](#)

**Table 70. SnPb eutectic process (from J-STD-020D)**

| Package thickness (mm) | Package reflow temperature (°C) |       |
|------------------------|---------------------------------|-------|
|                        | Volume (mm <sup>3</sup> )       |       |
|                        | < 350                           | ≥ 350 |
| < 2.5                  | 235                             | 220   |
| ≥ 2.5                  | 220                             | 220   |

**Table 71. Lead-free process (from J-STD-020D)**

| Package thickness (mm) | Package reflow temperature (°C) |             |        |
|------------------------|---------------------------------|-------------|--------|
|                        | Volume (mm <sup>3</sup> )       |             |        |
|                        | < 350                           | 350 to 2000 | > 2000 |
| < 1.6                  | 260                             | 260         | 260    |
| 1.6 to 2.5             | 260                             | 250         | 245    |
| > 2.5                  | 250                             | 245         | 245    |

Moisture sensitivity precautions, as indicated on the packing, must be respected at all times.

Studies have shown that small packages reach higher temperatures during reflow soldering, see [Figure 48](#).

For further information on temperature profiles, refer to Application Note *AN10365* “Surface mount reflow soldering description”.

## 27. Legal information

### 27.1 Data sheet status

| Document status <sup>[1][2]</sup> | Product status <sup>[3]</sup> | Definition  |
|-----------------------------------|-------------------------------|---|
| Objective [short] data sheet      | Development                   | This document contains data from the objective specification for product development. |
| Preliminary [short] data sheet    | Qualification                 | This document contains data from the preliminary specification.                       |
| Product [short] data sheet        | Production                    | This document contains the product specification.                                     |

[1] Please consult the most recently issued document before initiating or completing a design.

[2] The term 'short data sheet' is explained in section "Definitions".

[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL <http://www.nxp.com>.

### 27.2 Definitions

**Draft** — The document is a draft version only. The content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information.

**Short data sheet** — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

**Product specification** — The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

### 27.3 Disclaimers

**Limited warranty and liability** — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the *Terms and conditions of commercial sale* of NXP Semiconductors.

**Right to make changes** — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

**Suitability for use** — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors and its suppliers accept no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

**Applications** — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

**Limiting values** — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

**Terms and conditions of commercial sale** — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at <http://www.nxp.com/profile/terms>, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

**No offer to sell or license** — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

**Export control** — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

**Non-automotive qualified products** — Unless this data sheet expressly states that this specific NXP Semiconductors product is automotive qualified, the product is not suitable for automotive use. It is neither qualified nor tested in accordance with automotive testing or application requirements. NXP Semiconductors accepts no liability for inclusion and/or use of non-automotive qualified products in automotive equipment or applications.

In the event that customer uses the product for design-in and use in automotive applications to automotive specifications and standards, customer (a) shall use the product without NXP Semiconductors' warranty of the product for such automotive applications, use and specifications, and (b) whenever customer uses the product for automotive applications beyond NXP Semiconductors' specifications such use shall be solely at customer's

own risk, and (c) customer fully indemnifies NXP Semiconductors for any liability, damages or failed product claims resulting from customer design and use of the product for automotive applications beyond NXP Semiconductors' standard warranty and NXP Semiconductors' product specifications.

**Translations** — A non-English (translated) version of a document is for reference only. The English version shall prevail in case of any discrepancy between the translated and English versions.

| <b>7</b> | <b>Pinning information</b> . . . . .            | <b>4</b> | 8.9.1    | ILPA/ILPB: interrupt level or pulse mode  | 39 |
| 7.1      | Pinning   | 4        | 8.9.2    | Interrupt enable bits   | 40 |
| 7.2      | Pin description                                 | 6        | 8.10     | Oscillator register   | 42 |
| <b>8</b> | <b>Functional description</b> . . . . .         | <b>7</b> | 8.10.1   | CLKIV: invert the clock output  | 42 |
| 8.1      | Registers organization overview                 | 8        | 8.10.2   | OFFM: offset calibration mode   | 42 |
| 8.1.1    | Time mode registers                             | 8        | 8.10.3   | 12_24: 12 hour or 24 hour clock   | 42 |
| 8.1.1.1  | RTC mode time registers overview (RTCM = 0)     | 9        | 8.10.4   | LOWJ: low jitter mode   | 42 |
| 8.1.1.2  | Stop-watch mode time registers (RTCM = 1)       | 11       | 8.10.5   | OSCD[1:0]: quartz oscillator drive control  | 43 |
| 8.1.2    | Control registers overview                      | 13       | 8.10.6   | CL[1:0]: quartz oscillator load capacitance   | 43 |
| 8.2      | RTC mode time and date registers                | 14       | 8.11     | Battery switch register   | 44 |
| 8.2.1    | Definition of BCD                               | 14       | 8.11.1   | BSOFF: battery switch on/off control  | 44 |
| 8.2.2    | OS: Oscillator stop                             | 15       | 8.11.2   | BSRR: battery switch internal refresh rate  | 45 |
| 8.2.3    | EMON: event monitor                             | 15       | 8.11.3   | BSM[1:0]: battery switch mode   | 45 |
| 8.2.4    | Definition of weekdays                          | 16       | 8.11.3.1 | Switching at the V <sub>th</sub> level, BSM[1:0] = 00                               | 46 |
| 8.2.5    | Definition of months                            | 16       | 8.11.3.2 | Switching at the V <sub>BAT</sub> level, BSM[1:0] = 01                              | 47 |
| 8.2.6    | Setting and reading the time in RTC mode        | 17       | 8.11.3.3 | Switching at the higher of V <sub>BAT</sub> or V <sub>th</sub> level, BSM[1:0] = 10 | 48 |
| 8.3      | Stop-watch mode time registers                  | 18       | 8.11.3.4 | Switching at the lower of V <sub>BAT</sub> and V <sub>th</sub> level, BSM[1:0] = 11 | 49 |
| 8.3.1    | Setting and reading the time in stop-watch mode | 18       | 8.11.4   | BSTH: threshold voltage control   | 49 |
| 8.4      | Alarms  | 19       | 8.11.5   | Battery switch interrupts   | 49 |
| 8.4.1    | Alarms in RTC mode                              | 19       | 8.12     | Pin_IO register   | 50 |
| 8.4.1.1  | Alarm1 and alarm2 registers in RTC mode         | 19       | 8.12.1   | CLKPM: CLK pin mode control   | 50 |
| 8.4.1.2  | Alarm1 and alarm2 control in RTC mode           | 20       | 8.12.2   | TSPULL: TS pin pull-up resistor value   | 50 |
| 8.4.1.3  | Alarm1 and alarm2 function in RTC mode          | 21       | 8.12.3   | TSL: TS pin level sense   | 51 |
| 8.4.2    | Alarms in stop-watch mode                       | 23       | 8.12.4   | TSPM[1:0]: TS pin I/O control   | 51 |
| 8.4.2.1  | Alarm1 and alarm2 registers in stop-watch mode  | 23       | 8.12.4.1 | TS pin output mode; INTB  | 51 |
| 8.4.2.2  | Alarm1 and alarm2 control in stop-watch mode    | 23       | 8.12.4.2 | TS pin output mode; CLK   | 52 |
| 8.4.2.3  | Alarm1 and alarm2 function in stop-watch mode   | 24       | 8.12.4.3 | TS pin disabled   | 52 |
| 8.4.3    | Alarm interrupts                                | 25       | 8.12.5   | TSIM: TS pin input type control   | 52 |
| 8.5      | WatchDog  | 26       | 8.12.5.1 | TS pin input mode   | 52 |
| 8.5.1    | WatchDog functions                              | 26       | 8.12.6   | INTAPM[1:0]: INTA pin mode control  | 52 |
| 8.5.1.1  | WatchDog repeat mode                            | 27       | 8.12.6.1 | INTAPM[1:0]: INTA   | 53 |
| 8.5.1.2  | WatchDog single shot mode                       | 27       | 8.12.6.2 | INTAPM[1:0]: clock data   | 53 |
| 8.5.1.3  | WatchDog interrupts                             | 28       | 8.12.6.3 | INTAPM[1:0]: battery mode indication  | 53 |
| 8.6      | RAM byte  | 28       | 8.13     | Function register   | 54 |
| 8.7      | Timestamps                                      | 28       | 8.13.1   | 100TH: 100th seconds mode   | 54 |
|          |   |          | 8.13.2   | PI[1:0]: Periodic interrupt   | 54 |
|          |   |          | 8.13.3   | RTCM: RTC mode  | 55 |
|          |   |          | 8.13.4   | STOPM: STOP mode control  | 55 |
|          |   |          | 8.13.5   | COF[2:0]: Clock output frequency  | 56 |
