PTN5100

USB Type-C power delivery PHY and protocol IC

Rev. 1.1 — 25 July 2017 Product data sheet

1. General description

PTN5100 is a single port USB Type-C Power Delivery (PD) PHY and Protocol IC that provides Type-C Configuration channel interface and USB PD Physical and Protocol layer functions to a System PD Port Policy Controller (Policy Engine and Device Policy Manager, Alternate mode controller). It complies with USB PD[1] and Type-C[2] specifications and delta updates of PD spec. This IC is targeted for a wide range of platforms (Standard Notebook PCs, Desktop PCs, Chromebooks, Tablets, Convertibles, Smart phones) and PC Accessories (e.g. Docks, Monitors, Cable adapters etc.) applications. PTN5100 is architected to deliver robust performance, compliant behavior, configurability and system implementation flexibility that are essential to tide over interoperability and compliance hurdles in the platform applications.

PTN5100 can support system realization of the following PD roles: (i) Provider (P) only, (ii) Provider/Consumer (P/C) (iii) Consumer only (C) (iv) Consumer/Provider (C/P). Further, it can be register programmed to operate in Type-C specific Upstream Facing Port (UFP), Downstream Facing Port (DFP) or Dual Role Port (DRP) role.

PTN5100 implements VCONN low RON switch with register programmable Forward Current protection feature. The VCON switch also provides Reverse current protection feature to detect reverse current flow into the system whenever (inductive or) charged cable is unplugged from the connector.

PTN5100 operates from platform power supply VDD, or it can also be powered from USB power VBUS directly, which is especially required for operation under Dead Battery (DB) condition and certain platform use cases. The host interface operates on VIO supply to facilitate interfacing to systems that use IO supply rail different from VDD supply rail.

It provides SPI/I2C interface for system host control/status update. The interface choice is pre- configured in NXP factory.

PTN5100 is available in a small footprint package option: HVQFN20 4 mm x 4 mm, 0.5 mm pitch.

Remark:

1. The term 'EC' is used interchangeably with 'Embedded Controller', 'AP', 'Application Processor' or 'System Management Controller, SMC' or System Host Controller throughout this document.
2. The terms 'PMIC', 'Power Management Interface Controller', 'Charger IC' are used interchangeably throughout this document.

2. Features and benefits

2.1 USB PD and Type-C Features

Complies with USB PD[1] and USB Type-C[2] specifications.

- Supports implementation of various system PD roles: P, P/C, C, C/P
- Supports Type-C role configurability
  - Type-C role (DFP, UFP, DRP) is Non-Volatile Memory (NVM) and register programmable based on OEM platform requirements
  - Implements UFP role pull down behavior to handle dead battery condition on battery powered platforms
  - Supports register programmable and variable ‘Rp’ indication (for DRP/DFP usage and accessory detection)
  - Implements 'Rd' indication on CC pin (for Device side implementation)
  - CC detection/indication scheme based on Type-C role
  - Indication of orientation detection via CC_ORIENT pin and status register(s)
  - Debug and Audio Accessory detection and indication in status register(s)
- Cooperatively works under the control of Policy controller MCU for power delivery negotiation and contract(s), Alternate mode and VDM exchanges
  - Implements BMC (de)coding, 4B5B symbol (de)coding, CRC generation/checking, PD packet assembling/disassembling including Preamble, SOP, EOP, Good CRC response, Retries, Hard and Cable resets
  - PD PHY and Protocol layer interface control and status update handled via SPI/I2C interface
- SOP* Configurability
  - Register programmable to generate and receive SOP, SOP', SOP'-debug, SOP'', SOP''-debug'' in DFP/DRP (host use case)
  - Register programmable to receive and respond on SOP, SOP'-debug and SOP''-debug commands
- Supports low RON VCONN switch with enable/disable (Hi-Z) support
  - Capable of maximum current delivery of 1 A over 2.7 V to 5.5 V
  - Supports register programmable Forward current protection control
  - Supports register programmable Reverse current protection

2.2 System protection features

- Back current protection on all pins when PTN5100 is unpowered
- CC1 and CC2 pins are 5.5 V tolerant
- VBUS pin and VBUS power path MOSFET enable pins are 28 V tolerant

2.3 General

- Delivers (active LOW enable) gate control signals for PMOS Power MOSFETs on VBUS source and sink power paths
- Provides dedicated IO pin (CC_ORIENT) for indicating Cable/plug orientation and IO pin (DBGACC_FOUND) for indicating Debug accessory detection
- Delivers up to 30 mA (max) for powering Policy controller MCU
- Supports SPI slave interface (SPI modes 1 and 2 supported) up to 30 MHz

All information provided in this document is subject to legal disclaimers.

© NXP Semiconductors N.V. 2017. All rights reserved.

- Supports I2C slave interface standard mode (100 kHz), Fast mode (400 kHz) and Fast mode plus (1 MHz)
- I2C Device slave address programmable up to 3 values
- Supports 3.3 V or 1.8 V capable I^2C-bus or SPI interface
  - Supports register access - device configuration, control and status/interrupt interfacing through Slave I^2C-bus interface
- Power supplies - VDD (3.3 V ±10 %) or VBUS
  - Tolerant up to 28 V on VBUS and operational up to maximum of 25 V on VBUS
- Operating temperature −20 °C to 85 °C
- ESD 8 kV HBM, 1 kV CDM
- Package: HVQFN20 4 mm × 4 mm, 0.5 mm pitch

3. Applications

- PC platforms: Notebook PCs, Desktop PCs, Ultrabooks, Chromebooks
- Tablets, 2:1 Convertibles, Smartphones and Portable devices
- PC accessories/peripherals: Docking, Mobile Monitors, Multi-Function Monitors, Portable/External hard drives, Cable adaptors, Dongles and accessories, etc.

4. Ordering information

Table 1. Ordering information

Type number	Topside marking	Package		
		Name	Description	Version
PTN5100BS	5100	HVQFN20	plastic thermal enhanced very thin quad flat package; no leads; 20 terminals; body 4 × 4 × 0.85 mm[2]	SOT917-4
PTN5100ABS	510A	HVQFN20	plastic thermal enhanced very thin quad flat package; no leads; 20 terminals; body 4 × 4 × 0.85 mm[3]	SOT917-4

[1] Total height after printed-circuit board mounting <=1 mm (maximum)

[2] Supported system interface - SPI

[3] Supported system interface - I^2C

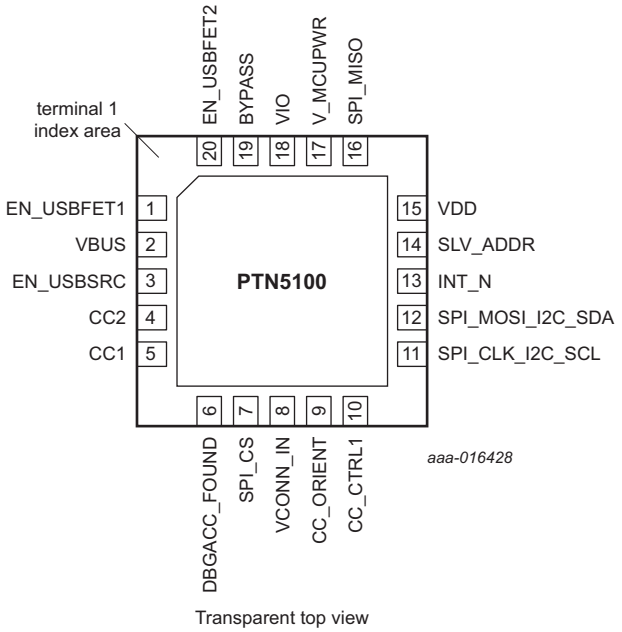
6. Pinning information

6.1 Pinning



Note: HVQFN20 package ground is connected to exposed center pad. The exposed center pad must be connected to platform supply ground for proper device operation. For enhanced thermal, electrical, and board level performance, the exposed pad needs to be soldered to the board using a corresponding thermal pad on the board and for proper heat conduction through the board, thermal vias need to be incorporated in the PCB in the thermal pad region.

6.2 Pin description

Table 3. Pin description

Symbol	Pin	Pin direction	Pin Type	Description
EN_USBSRC	3	Output	Open drain	USB PD VBUS Source Power path PMOS FET gate Active Low enable. At default/POR, this pin is Hi-Z; PTN5100 drives this pin LOW based on Type-C connection state and/or policy controller MCU command. The pin status can be read in the internal register(s).
EN_USBFET1	1	Output	Open drain	USB PD VBUS Source or Sink Power path PMOS FET gate Active Low enable. At default/POR, this pin is Hi-Z; PTN5100 drives this pin LOW based on Type-C connection state and/or policy controller MCU command. The pin status can be read in the internal register(s).
EN_USBFET2	20	Output	Open drain	USB PD VBUS Source or Sink Power path PMOS FET gate Active Low enable. At default/POR, this pin is Hi-Z; PTN5100 drives this pin LOW based on policy controller MCU command. The pin status can be read in the internal register(s).
CC1	5	IO	Custom IO	Type-C Configuration channel #1 TVS or similar protection diode (e.g. PESD5V0S1USF, PESD5V0S1UL, etc.) shall be used to protect the CC1/2 pins from overshoot/undershoot during cable plug/unplug and cable discharge events.
CC2	4	IO	Custom IO	Type-C Configuration channel #2 TVS protection diode (e.g. PESD5V0S1USF, PESD5V0S1UL, etc) shall be used to protect the CC1/2 pins from overshoot/undershoot during cable plug/unplug and cable discharge events.
CC_ORIENT	9	Output	CMOS IO on VIO power rail	This pin indicates Type-C cable plug orientation. The pin's polarity is inverted at power-on reset and the PD policy controller MCU has to initialize PTN5100D before the pin level is valid. After the initialization, the pin indicates orientation as follows: LOW = Normal plug orientation (CC communication on CC1) HIGH = Reverse plug orientation (CC communication on CC2) Default pin value is LOW even if there is no connection or normal plug connection
CC_CTRL1	10	Input	Analog Input	Input to indicate whether to present ‘Rd’ or Open on CC pin under Unpowered condition
DBGACC_ FOUND	6	Output	CMOS IO on VIO power rail	Indicates the presence of Type-C Debug accessory Default/POR value is LOW
VCONN_IN	8	Input	Power	VCONN power input from system side

All information provided in this document is subject to legal disclaimers.

Table 3. Pin description *…continued*

Symbol	Pin	Pin direction	Pin Type	Description
SPI_MOSI_ I2C_SDA	12	IO	Open drain IO (I2C mode) referenced to VIO voltage V_MCUPWR power rail (SPI mode)	Dual purpose pin. In I2C slave mode, this serves as I2C data input/output (open drain) In SPI slave mode, this pin serves Master Output Slave Input function (push pull CMOS IO)
SPI_MISO	16	Output	V_MCUPWR rail	This serves Master Input Slave Output function of SPI interface
SPI_CLK_I2C_SCL	11	Input	Open drain IO (I2C mode) referenced to VIO voltage V_MCUPWR power rail (SPI mode)	Dual purpose pin. In I2C slave mode, this serves as I2C clock input (open drain). In SPI slave mode, it serves as SPI clock input pin
SPI_CS	7	Input	V_MCUPWR rail	This pin provides SPI chip select Input
INT_N	13	Output	Open drain	Level triggered interrupt. Open drain output; This pin needs to be externally pulled up VIO. This pin is usable only when VDD is valid
SLV_ADDR	14	Ternary input	V_MCUPWR rail	Ternary slave address (I2C) pin
V_MCUPWR	17	Output	Power	This pin delivers current up to 30 mA (max) to policy controller MCU. External supply de-coupling capacitor(s) (2.2 μF ±10 % ceramic capacitor) are required
VIO	18	Input	Power	IO domain power supply. External supply de-coupling capacitor(s) are required
VBUS	2	Input	Power	VBUS power supply. External supply de-coupling capacitor(s) are required
VDD	15	Input	Power	Core domain power supply. External supply de-coupling capacitor(s) are required
BYPASS	19	Internal	Internal power rail	Internal power rail. A ceramic capacitor (2.2 μF ±10 %) is to be connected to this pin
GND	Center pad		GND	Ground Center pad

7. Functional description

PTN5100 is a 1-port USB Type-C PD Physical and Protocol Layer IC that can be used to realize single or multi-port USB Type-C PD and/or Alternate mode implementations. It complies with USB PD [1] and Type-C specifications [2]. PTN5100 supports the following use configurations:

1. On a System Host (single or multi-port configuration)
   a. Controlled by a PD Policy controller and/or Alternate mode control MCU
   b. Controlled by Embedded controller or Application processor
2. On a Device platform

All information provided in this document is subject to legal disclaimers.

© NXP Semiconductors N.V. 2017. All rights reserved.

a. Controlled by a PD policy controller or Alternate mode control MCU or existing processor

On the host and device use cases, different PD roles are possible: (P), (P/C), (C), (C/P).

PTN5100 supports two levels of configurability and programmability:

- NVM configuration options - configurability in the factory through NVM configuration utility
- I2C/SPI register programmable - read/write accesses at application/Firmware (FW) level

PTN5100 can be partitioned into the following major functional blocks along with their respective interfaces:

- Type-C Configuration Channel functional block
- USB Power Delivery function
- VCONN Low RON Switch
- Power FET Enable Control
- MCU interface and Control

The following subsections describe the PTN5100 with its major functional blocks.

7.1 Type-C Configuration Channel functional block

Type-C Configuration Channel (CC) function operates as a front end to cable/plug interface.

PTN5100 can operate autonomously or under MCU control. To support use cases especially with autonomous mode, PTN5100 implements HW circuitry to perform the following operations:

- Applying 'Rp' or 'Rd' depending on the (NVM) configured role
- Detecting cable/plug connect and disconnect events
- Indicating Type-C current limit level in a system under DFP role
- Detecting the current level supported by remote end under UFP role
- Identifying plug orientation and indicating through CC_ORIENT pin
- Identifying Type-C Debug accessory detection and indicating through DBGACC_FOUND pin
- Updating event, interrupt and status registers and raising interrupt signal using INT_N pin

In order to provide reliable connect/disconnect event triggers, debouncing is also implemented as per [2].

PTN5100 allows for NVM configurability and/or register programmability to enable usage under different platform configurations.

All information provided in this document is subject to legal disclaimers.

7.2 USB Power Delivery Function

In general, the Embedded Controller (EC) or System Management Controller (SMC) handles the overall Application/Platform power management given the system states, battery status, etc. It reviews capabilities and status of various power providers (USB PD, AC-DC adapter, battery, docking, etc.) dynamically and determines a specific source for powering/charging the platform - the power source selection is an important and platform dependent aspect of Application power delivery scheme.

- For example, in some computing applications, EC plays a central role in controlling the various power sources including USB PD. To support this, PTN5100 and Policy controller MCU can be configured to negotiate and agree on power contract based on command/response exchanges with EC
- In several applications, EC may not even exist or EC wants to play a hands-off role. To support these applications, PTN5100 and Policy controller MCU can be configured to operate autonomously

In a Type-C PD implementation, the system partitioning involves the following parts:

- Port PHY and Protocol layer functions → PTN5100
- Port policy engine and device policy management, Alternate mode support → Discrete policy controller MCU
- System management → EC or SMC

PTN5100 implements USB PD PHY layer and HW intensive Protocol functions and it works along with a discrete MCU to implement Full PD functionality. The combined 2-chip system solution (PTN5100 and MCU) can be configured to support one or more of the following PD roles:

1. PD Consumer (C)
2. PD Consumer/Provider (C/P)
3. PD Provider (P)
4. PD Provider/Consumer (P/C)

The interface between PTN5100 and Policy controller MCU can be either SPI or I2C. PTN5100 provides a transparent set of commands and register interface for the MCU to control the operation and ensure safe/suitable system behavior/response. PTN5100 Application Programming guide [3] describes the register set supported for the PD control, status updates and operational control/sequences.

The policy controller MCU implements PD port policy layer as per [1]. The default PD power profiles are configured in the MCU and the EC could request for specific profile and PD contract based on platform application. The 2-chip solution can operate autonomously or under EC control.

All information provided in this document is subject to legal disclaimers.

Fig 3. PTN5100 to MCU

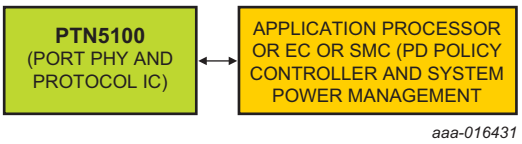

Fig 4. PTN5100 to EC

PTN5100 implements USB PD PHY layer function as follows:

- Slew rate controlled IO
- Bit transmission and data recovery
- Bi-phase Mark Coding
- 4B5B Line coding
- CRC computation and checking

It handles the following Protocol layer functions:

- Data Packetization and Extraction
- Good CRC Response
- Automated Retries
- Hard reset, Cable reset
- Tx and Rx buffer management

It handles both Transmit and Receive operation and it maintains dedicated TX and RX data buffers. To minimize chances of collision, PTN5100 checks the CC line before start of transmission. Once the data is transmitted or received, the I2C interface status is updated and MCU is interrupted.

BIST mode (Tx, Rx) is also supported.

Note: NXP is open to engage on Firmware licensing to give a head start to customers on USB PD Policy and Alternate mode Firmware front. Please contact NXP for further details.

7.3 VCONN Switch

Type-C specification defines a dedicated power pin VCONN_IN to deliver power to full featured cables, dongles and cable adapters.

All information provided in this document is subject to legal disclaimers.

© NXP Semiconductors N.V. 2017. All rights reserved.

PTN5100 implements very low RON switch that can deliver up to 1 A current. Depending on the pin over which CC communication is established, VCONN power is delivered into the other CC pin. With patented architecture, the switch implements Soft Start behavior to avoid heavy inrush current flow.

The VCONN switch is to be used only when VCONN_IN lies within the valid range (2.7 V to 5.5 V).

The VCONN switch can be enabled or disabled by Firmware. When in disabled condition, it presents Hi-Z condition. The switch implements two important features related to robustness:

- Forward Current Protection (FCP) that monitors over current condition (over current limit is register programmable) and trips the connection by disabling the switch
- Reverse Current Protection (RCP) that avoids reverse current flow back into the system due to inductive effects of cable unplug events

Further, both FCP and RCP circuitry shall be activated only when VCONN_IN is within valid range.

7.3.1 Forward Current Protection (FCP)

PTN5100 implements Forward current protection in VCONN switch that keeps monitoring for a current flow above the preconfigured level from the system side and whenever the threshold is exceeded, the switch is opened and an interrupt event is raised. The switch remains open until the port controller MCU reads the status and re-enables the switch.

7.3.2 Reverse Current Protection (RCP)

PTN5100 implements Reverse Current Protection in VCONN switch that watches for any instantaneous reverse current flow back into the system via VCONN and whenever the preconfigured threshold is exceeded, the switch is opened and an interrupt event is raised. The switch remains open until the port controller MCU reads the status and re-enables the switch.

7.4 Power FET control

PTN5100 implements three dedicated open drain IOs that can be used to control the external power MOSFETs and enable/ disable VBUS source and sink power paths of the system. These are enabled or disabled based on PD power role (provider or consumer) of the Type-C interface. Based on PD negotiation and contract, the policy controller MCU enables/disables the specific power path (source FET or sink FETs).

- EN_USBSRC: This pin is used to enable/disable the power MOSFETs that corresponds to VBUS source (e.g. 5V regulated output). The FET enable can be configured and controlled through the register interface by the MCU. The pin status is monitored and updated in a status register.
- EN_USBFET1: This pin is used to enable/disable the power MOSFETs that corresponds to USB PD power from external power sources or delivering VBUS power to external peripherals. Its specific use as a VBUS source or sink path control is programmable. The FET enable can be configured and controlled through the register interface by the MCU. The pin status is monitored and updated in a status register.

All information provided in this document is subject to legal disclaimers.

© NXP Semiconductors N.V. 2017. All rights reserved.

- EN_USBFET2: This pin is used to enable/disable the power MOSFETs that corresponds to USB PD power from external power sources or delivering VBUS power to external peripherals. It specific use as a VBUS source or sink path control is programmable. The FET enable can be configured and controlled through the register interface by the MCU. The pin status is monitored and updated in a status register.

7.5 MCU interface and control

PTN5100 works along with policy controller MCU to realize USB PD functionality and/or Alternate mode support. The MCU can control and interface with PTN5100 through a dedicated I2C/SPI interface. In a given system implementation, only one of the two interfaces (I2C, SPI) can be used. This selection can be static configured via NVM.

PTN5100 provides up to three I2C slave address combinations based on ternary pin (SLV_ADDR) setting as per the table below.

Table 4. I2C slave address combinations

SLV_ADDR pin	Device address (Write/read)
GND	0xE0/0xE1
VDDIO	0xE4/0xE5
Unconnected	0xE8/0xE9

7.5.1 I²C-bus interface

PTN5100 has a slave I2C interface through which it provides a mechanism for control and status interaction/communication with the MCU. It supports Standard mode, Fast mode and Fast mode plus.

7.5.1.1 I2C writes

The following figure shows the basic protocol for I2C writes. A 16-bit offset is used to address each register.

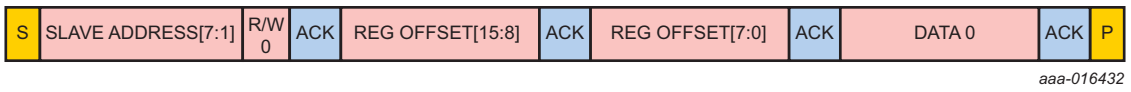

Fig 5. I2C writes

7.5.1.2 I2C reads

The following figure shows the basic protocol for I2C reads. They start off like I2C writes by specifying a 16-bit register offset. This is followed by a repeat start condition, the Slave Address (Read), and the read data.

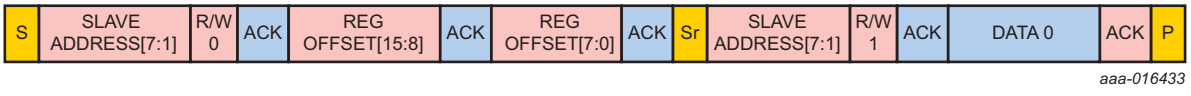

Fig 6. I2C reads

All information provided in this document is subject to legal disclaimers.

© NXP Semiconductors N.V. 2017. All rights reserved.

7.5.1.3 I2C address auto-incrementing

Bursts are allowed during writes and reads. Bit 15 of the register offset is the auto-increment indication. If ‘0’ then the internally generated MMIO address will not increment with each data byte. If ‘1’, then the address will increment with each data byte.

A detailed description of the I^2C-bus specification, with applications, is given in user manual UM10204, "I^2C-bus specification and user manual" [4]. Referring to I2C protocol, PTN5100 positively acknowledges all 256 register offset addresses, though there are certain undefined address offsets.

7.5.2 SPI interface

PTN5100 provides an SPI slave interface as well. It supports SPI modes 1 and 2. This interface exposes same register interface as that of I2C. Its main advantage is faster command and data transport and relaxes MCU response time/latency requirements.

7.5.3 Register interface

PTN5100 Application programming guide [3] describes the various registers with their bit definitions, POR values and the various functions. Also, sample 'C' programs corresponding to various functions and operations are given. This guide can be used by the platform system architects to implement the EC firmware to control the operations with PTN5100. Refer to programming guide for more information. The register definitions are also described in the guide.

7.5.4 Relevant Interface pins - SLV_ADDR, SPI_CLK_I2C_SCL, SPI_MOSI_I2C_SDA, SPI_CS, SPI_MISO, INT_N

- SLV_ADDR is a ternary input pin that is used to support up to 3 slave PTN5100 devices on a given platform. This pin can be pulled to V_MCUPWR rail, left open or pulled to GND.
- While in SPI mode, SPI_CLK_I2C_SCL, SPI_MISO, SPI_MOSI_I2C_SDA and SPI_CS provide the necessary interface for connecting to SPI master controller on the MCU.
- While in I2C mode, SPI_CLK_I2C_SCL and SPI_MOSI_I2C_SDA are used for I2C clock and data interfacing to MCU
- INT_N pin is used to raise Active LOW level triggered interrupt signal to EC. PTN5100 processes various events and raises interrupt that require SMC intervention. Once all relevant events are processed by the MCU, the INT_N pin goes HIGH. At POR, this pin remains HIGH (when VIO is valid). The specific events that can generate the interrupt can be selected.

7.6 Power supplies

PTN5100 is designed to operate under various power supplies. It can operate under both normal battery and dead battery environments (while drawing power from VBUS). PTN5100 handles power supply transitions (VBUS, VDD) transparently and there is no specific power supply ramp requirement imposed on the system (between VDD and VIO rails) also.

The following table highlights the power supplies and operating conditions for PTN5100.

All information provided in this document is subject to legal disclaimers.

© NXP Semiconductors N.V. 2017. All rights reserved.

Table 5. Power supplies vs. operating conditions

Valid power supply input combination	Operational condition	Remarks
VDD, VIO	Normal powered condition (both battery based or non-battery based platforms)	All interfaces operational
VDD, VIO, VBUS	Normal powered condition; Host Platform may be powered/charged through VBUS simultaneously	All interfaces operational
VBUS, VIO(=V_MCUPWR)	Dead battery in battery based platforms or Normal powered condition under other platforms; Host Platform powered/charged through USB PD	All interfaces operational
VBUS	Dead battery operation; PTN5100 draws power from VBUS for its operation; Host Platform may be powered/charged through USB PD later	PTN5100 pins (dependent on VIO rail) are not operational

Remark: The Policy controller MCU is powered by PTN5100.

The relevant pins associated with this functional block are:

- VDD
- VIO
- VBUS
- V_MCUPWR
- BYPASS

8. PTN5100 - Use case view

Given that USB Power Delivery could address the requirements of a wide set of markets and product segments, PTN5100 is designed to work over a range of product categories, platform applications, use cases and usage roles. With its configurability, it can be serve the needs of both general and custom applications. Not limited to these but the following subsections illustrate a set the use cases of PTN5100.

All information provided in this document is subject to legal disclaimers.

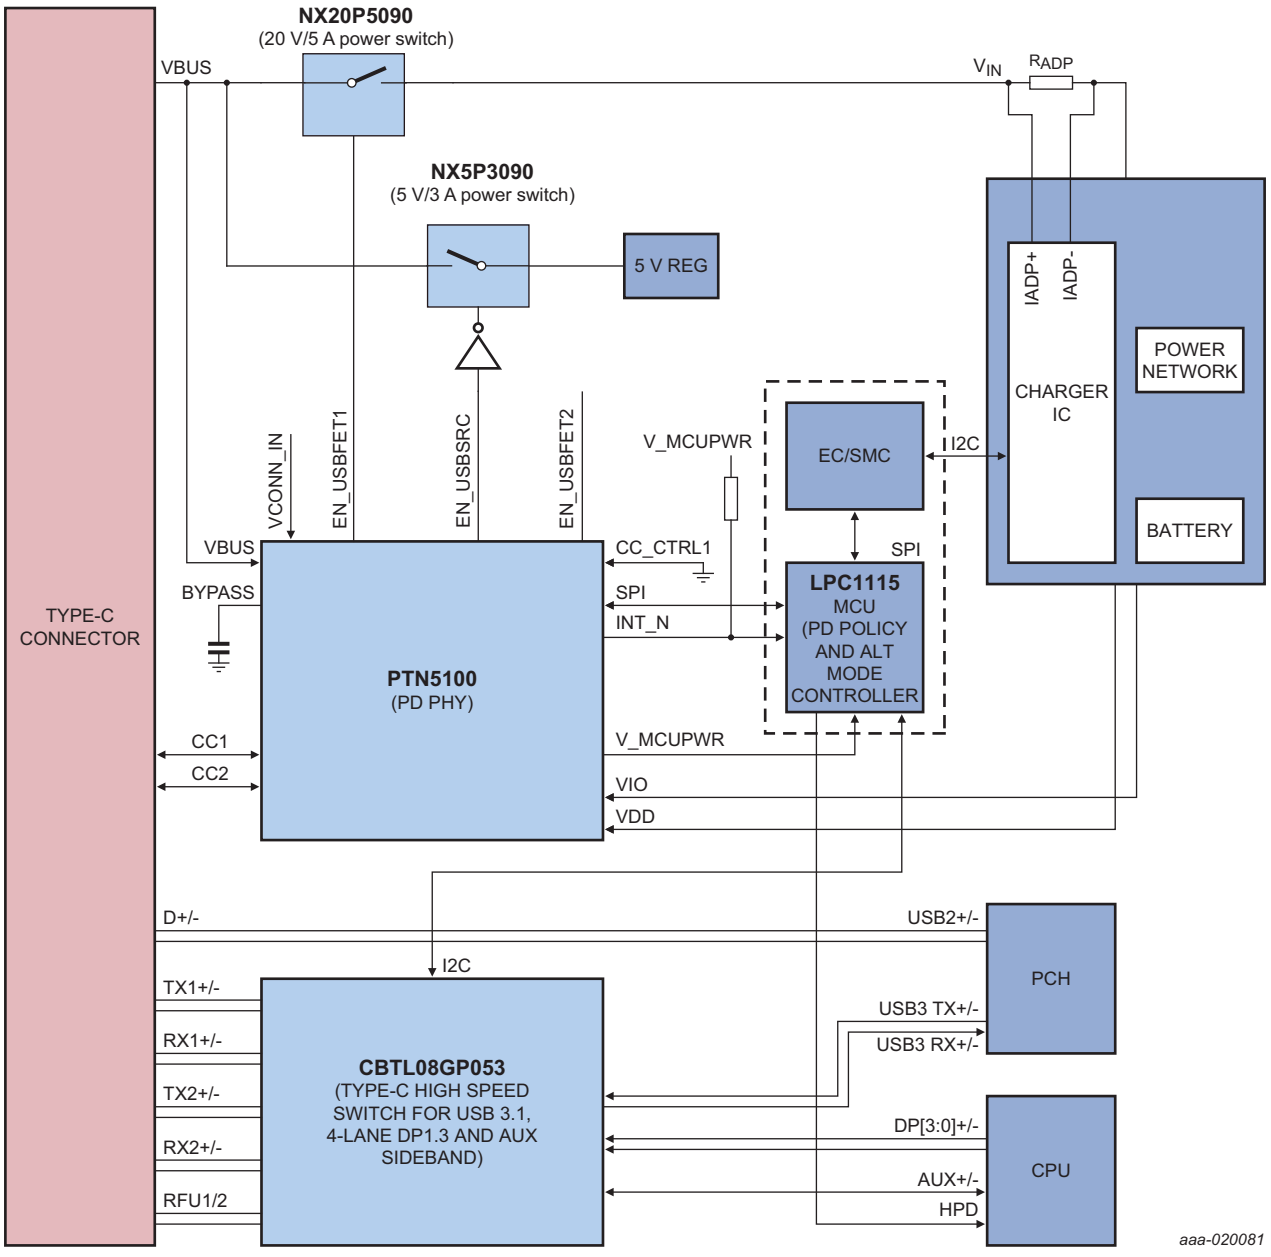

Fig 8. Illustrative diagram of Notebook/Ultrabook/Tablet application (Separate source and sink power paths): PD Provider/Consumer role (DFP role under Normal power/battery; UFP role under dead battery condition) 2 of 2

8.1.1.1 Brief description

In this illustration, the 2-chip solution (PTN5100 + Policy controller & Alternate mode MCU) is behind the Type-C receptacle and it is configured as a PD Provider/ Consumer. The EC interfaces with the Charger IC to configure at specific voltage/ current levels to perform battery charging and/or powering of the platform.

This application is expected to:

All information provided in this document is subject to legal disclaimers.

© NXP Semiconductors N.V. 2017. All rights reserved.

- Source VBUS 5 V (if not under dead battery)
- Charge from VBUS PD and AC barrel power, if applicable
- Source VCONN power

The EC communicates with controller MCU via an I2C bus and control the operations. The PTN5100 and MCU can operate autonomously or under the control of EC.

Figure 7 and Figure 8 illustrate the configurations with discrete MOSFETs and Power switches respectively. PTN5100 controls the power FETs/switch to determine charging (Green colored FETs/switch on VBUS power inputs) and 5 V VBUS power delivery (Orange colored FETs/switch on VBUS). If NXP5P3090 is used, then the Active HIGH switch enable control is required to be generated based on the EN_USBSRC control output.

An important aspect to consider here is that PTN5100 would indicate a 'Rd' pulldown (UFP) under dead battery condition and this enables the port partner to provide VBUS at 5 V (provided the port partner is capable of acting as DFP). However, after system starts up, role swap has to be performed to become DFP. This is handled by PTN5100 and MCU together.

CC_ORIENT and DBGACC_FOUND outputs can be used by the platform, if necessary.

All information provided in this document is subject to legal disclaimers.

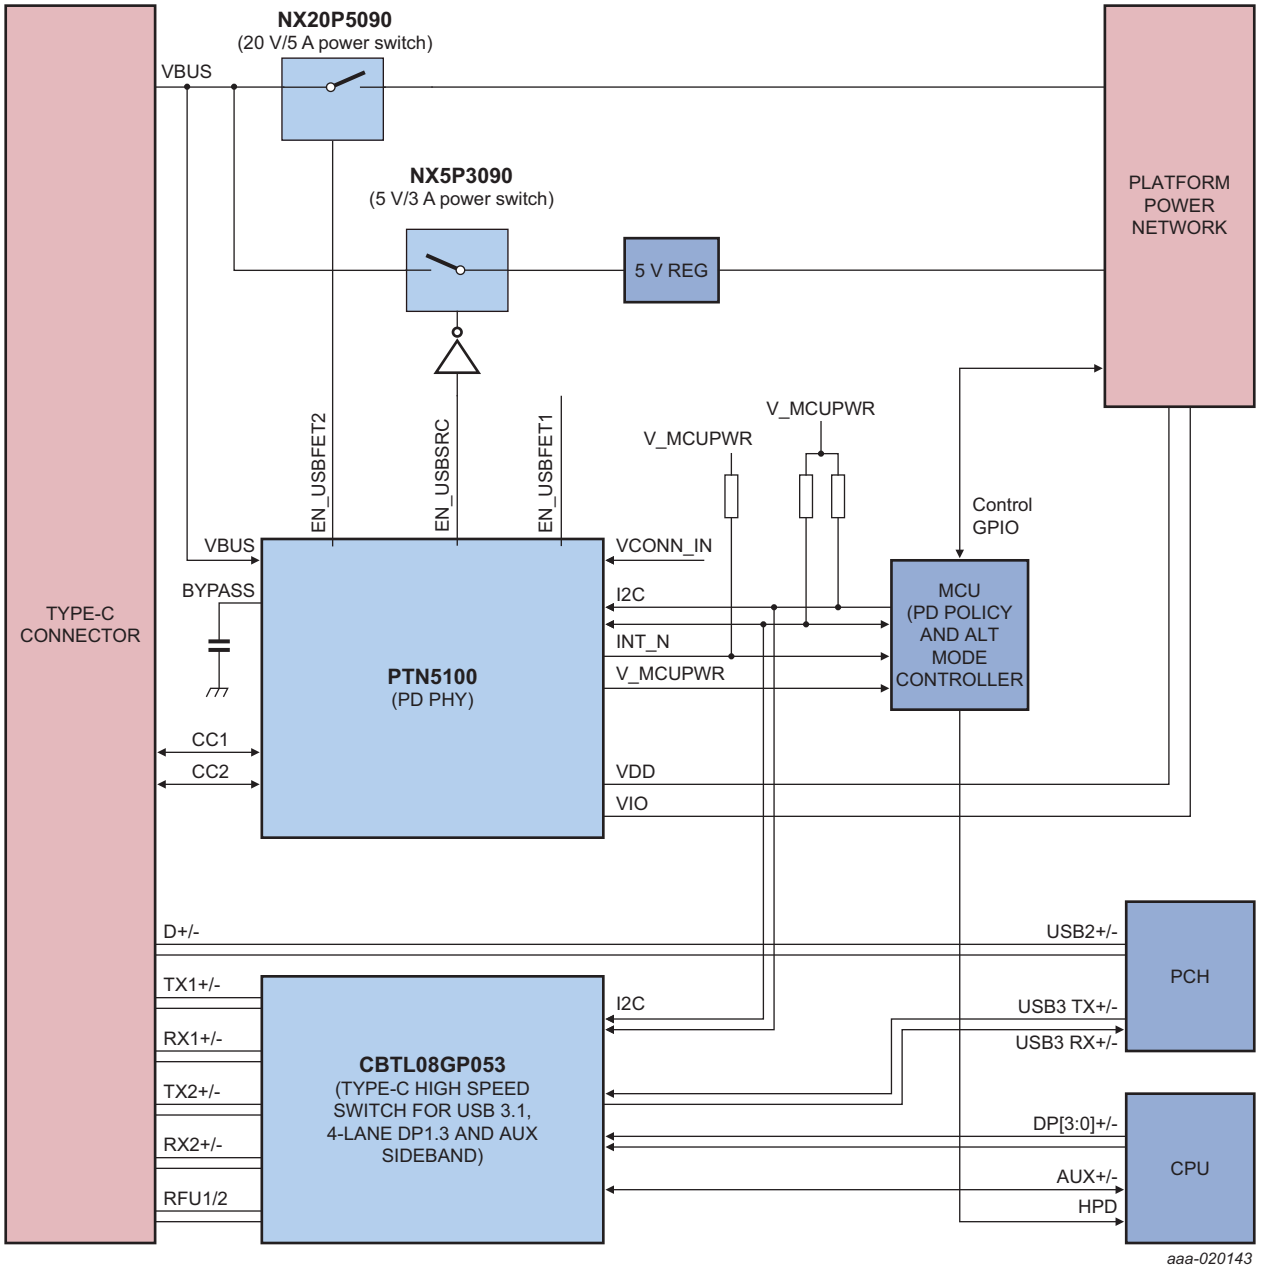

Fig 10. Illustrative diagram of Desktop PC application (Source power paths and FETs/power switches): PD Provider only (DFP role under powered condition and open under unpowered condition) 2 of 2

8.1.2.1 Brief description

In this illustration also, the 2-chip solution (PTN5100+ Policy controller & Alternate mode control MCU) is behind Type-C receptacle and it is configured to act as a PD Provider (Autonomous mode) based on pre-configured Power profiles. The PC system uses the ATX or similar power supply and it can deliver power to all USB ports. In this diagram, there is no EC to interface with and so, the 2-chip solution (MCU and PTN5100) is configured for autonomous operation.

All information provided in this document is subject to legal disclaimers.

For USB ports, this application:

- Sources VBUS 5 V
- Sources USB PD power (specific wattage depends on the system application)
- Sources VCONN power

Figure 9 and Figure 10 illustrate the configurations with discrete MOSFETs and Power switches respectively. PTN5100 controls the power FETs/switches to VBUS 5V and PD power (Orange colored FETs/Switch). The handshake with power supply unit is dependent on OEM/ODM design.

An important aspect to consider here is that a Desktop PC does not have dead battery condition though it can be unpowered. If not powered, it presents 'Open' on CC pins. After power up initialization, PTN5100 would indicate 'Rp'. After PD negotiation, the Desktop platform could deliver higher voltage/current.

CC_ORIENT and DBGACC_FOUND connections can be used based on platform need.

8.1.3 USB PD Consumer/Provider (Smartphone use case) - Standalone PTN5100

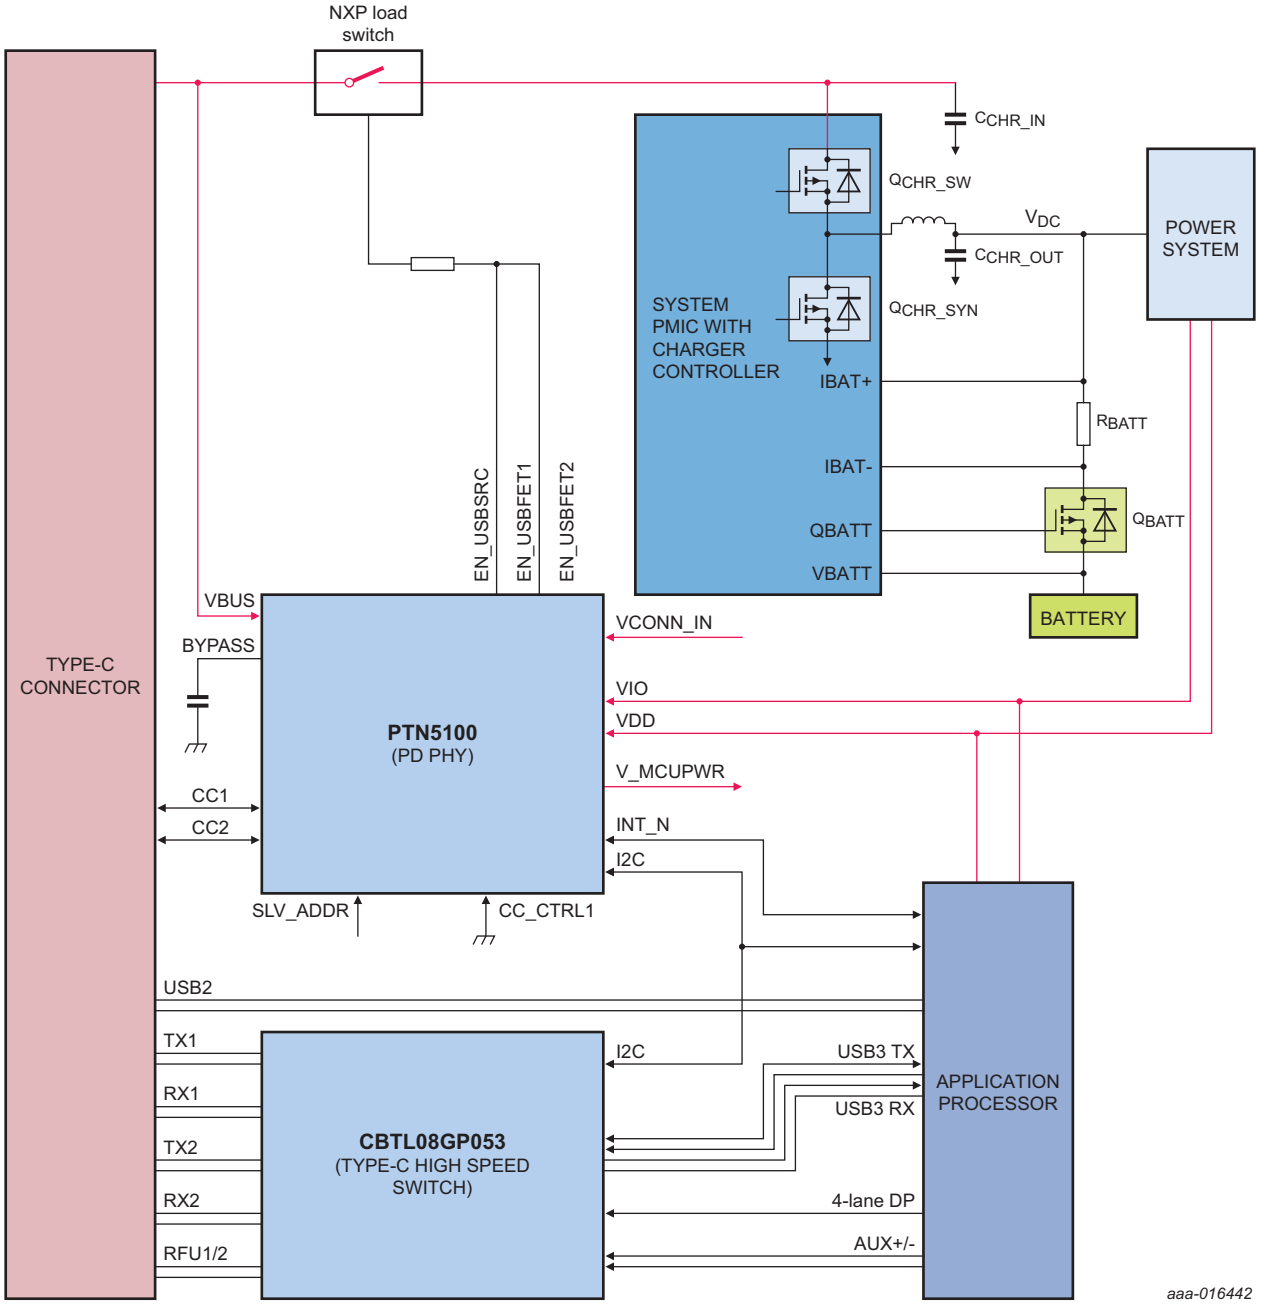

Fig 11. Illustrative diagram of Low power devices (e.g. Smartphones) that need 5 V, 3 A only: PD Consumer/Provider (DRP role with UFP in dead battery condition and DFP/UFP role depending on Type-C Partner capability

All information provided in this document is subject to legal disclaimers.

8.1.3.1 Application description

In this illustration, PTN5100 is behind Type-C receptacle and it is configured to act as a PD consumer/ Provider. It is important to note that there is no dedicated policy controller MCU associated with the PD functionality as this application can operate with 5V, 3A only. Under normal battery/powered condition, PTN5100 is configured as DFP, DRP or UFP based on register configuration setting and it performs cable/plug connect and disconnect detection, orientation detection. However, on dead battery condition, it defaults to UFP role. The power path FET control may or may not be used in the application depending on the capabilities of System PMIC.

This application is expected to

- Receive VBUS 5 V @ 3 A
- Provides VBUS 5 V @ 3 A
- Sourcing VCONN power is dependent on the Type-C role taken

PTN5100 operates autonomously but it is possible for the system processor to control it via I2C interface. Though there may not be a need to negotiate higher voltage/current, the platform may still need to support Alternate modes and VDMs. The Application Processor is used to handle those capabilities.

All information provided in this document is subject to legal disclaimers.

8.1.4 Type-C cable adapters with PTN5100

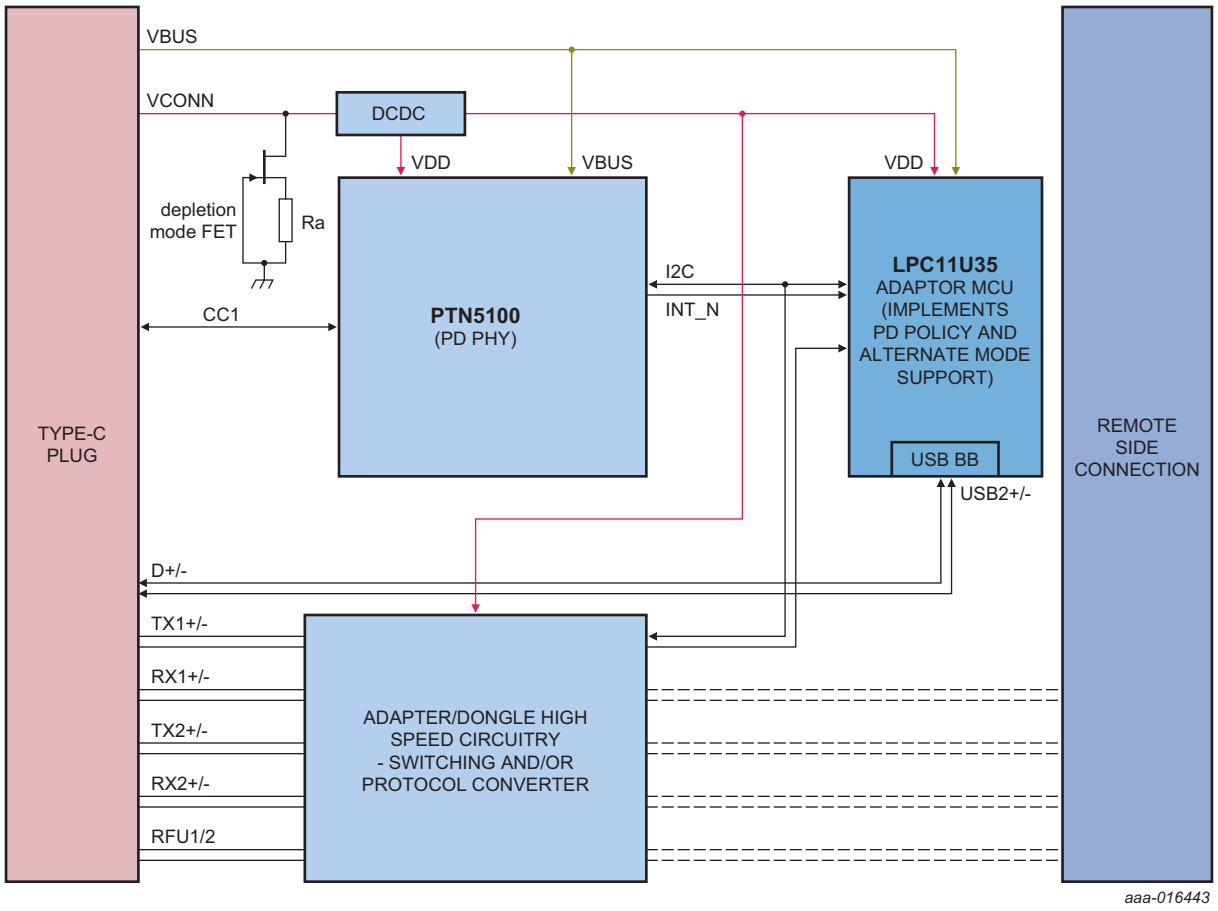

Fig 12. Illustrative diagram of Cable adapter use case (e.g. UFP in a Type-C to legacy adapter)

8.1.4.1 Application description

In this illustration, PTN5100 is inside Type-C cable adapter operating in UFP role. Some example use cases are Type-C to DP adapter, Type-C to VGA adapter, Type-C to Thunderbolt adapter etc. PTN5100 serves as PD PHY layer device for a Cable adapter management MCU or dedicated PD MCU wherein PD policy management, Alternate mode and VDM support are handled. The USB Billboard device is assumed to be implemented as part of adapter management MCU.

The cable adapter implementation operates on VCONN supply. Discrete depletion mode FET has to be used in the application for 'Ra' indication on CC pin.

All information provided in this document is subject to legal disclaimers.

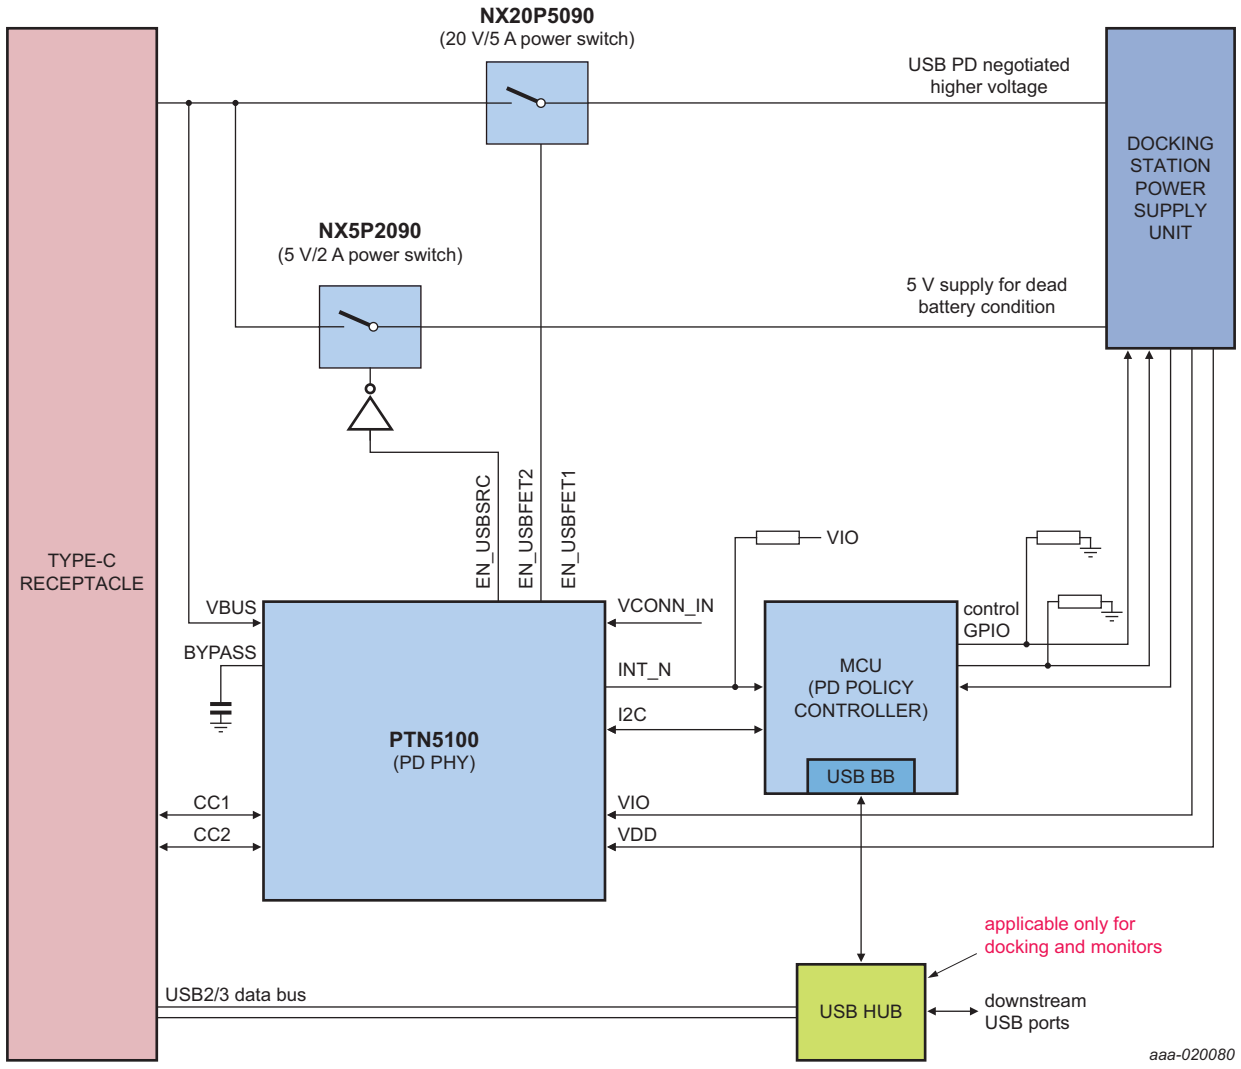

Fig 14. Illustrative diagrams of Docking/Multi-Function Monitor/Printer application (2 source power paths and FETs/power switches): PD Consumer/Provider (Charging UFP) 2 of 2

8.1.5.1 Application description

The example applications are Multi-function monitor, Dock or Printer. PTN5100 is configured for Charging UFP role. The policy controller MCU would probe PTN5100 to make sure there is no dead battery device connected at the other end. If a pulldown 'Rd' is detected at the remote cable end, this platform supplies VBUS 5V. Once the remote end system is capable of performing power role swap, the roles would be reversed.

This application is expected to:

- Receive VBUS 5 V (or provide power during Dead battery operation - VBUS 5 V)
- Provides VBUS PD power

The PD software running on the MCU controls the power FETs/switches to determine VBUS 5 V and USB PD power delivery (Orange colored power FETs/switch on VBUS).

8.1.6 USB PD Consumer with Type-C receptacle example

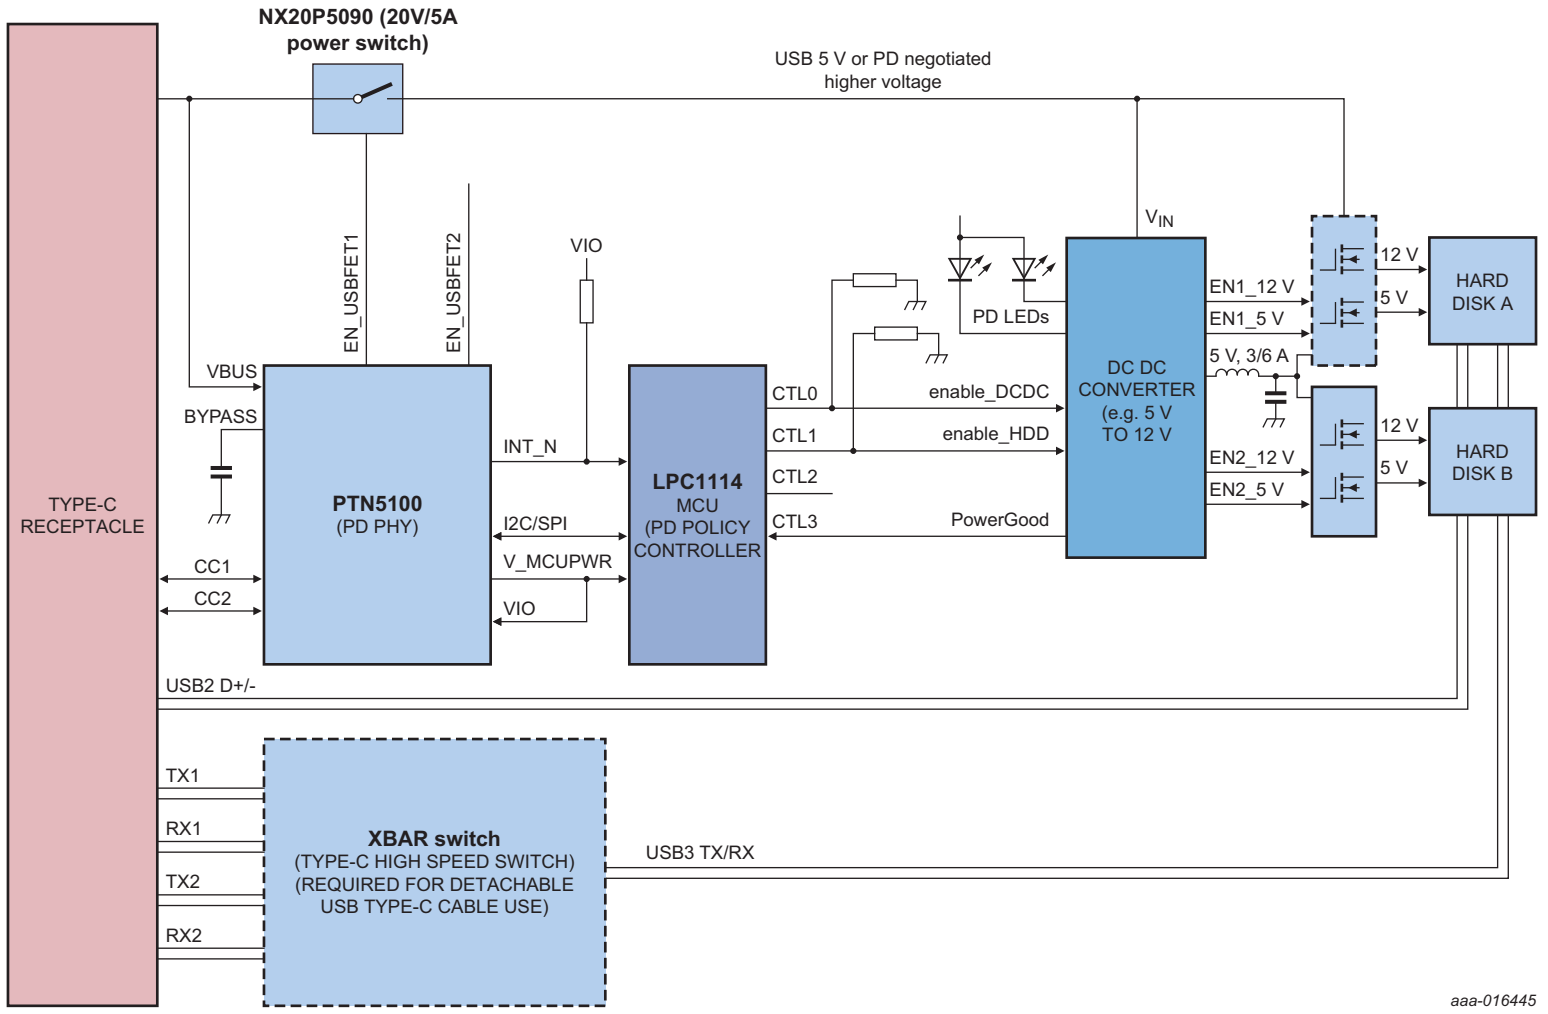

Fig 15. Illustrative diagram of Portable Hard Drive application (sink power path); PD Consumer only

All information provided in this document is subject to legal disclaimers.

© NXP Semiconductors N.V. 2017. All rights reserved.

8.1.6.1 Application description

In a USB PD based hard drive application, PTN5100 + Policy controller MCU operates autonomously. At POR, PTN5100 presents UFP role and starts to receive VBUS 5 V. Then based on configured power profile, PD negotiation and contracting is performed. The MCU interfaces with Hard drive electronics and delivers power after handshake. The MCU's GPIO pins can be reused to handshake with DCDC converter and the handshake mechanism is OEM platform dependent.

This application is expected to:

- Receive VBUS 5 V, USB PD power

All information provided in this document is subject to legal disclaimers.

11. Characteristics

11.1 Device characteristics

Table 8. Device characteristics

Applicable across operating temperature and power supply ranges as per Section 10 (unless otherwise noted). Typical values are specified at 27 °C (unless otherwise noted).

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
T_{FET_EN}	Time duration between I2C write/ACK and FET enable asserted	Applicable to all FET enable pins	-	-	10	µs
T_{FET_DIS}	Time duration between I2C write/ACK and FET enable de-asserted	Applicable to all FET enable pins	-	-	10	µs
$I_{DD,Active}$	Active mode operating current	UFP role; attached condition; V_{DD} = 3.3 V	-	200	-	µA
		DFP role; attached condition; V_{DD} = 3.3 V	-	300	-	µA
		SPI interface is active	-	3	-	µA
		PD mode is functional; does not include power delivered on V_MCUPWR pin; V_{DD} = 3.3 V	-	3	-	mA
	Additional current consumed on VDD	VCONN switch is enabled without FCP and RCP; V_{DD} = 3.3 V	-	175	250	µA
		VCONN switch is enabled with FCP and RCP; V_{DD} = 3.3 V	-	250	340	µA
$I_{DD(idle)}$	Idle mode current on VDD	UFP role; Unattached condition	-	50	-	µA
		DFP role; Unattached condition (Rp at standard current level)	-	70	-	µA
		DRP mode; Unattached condition	-	100	-	µA
$I_{VIO(idle)}$	Idle mode supply current (VIO)		-	-	10	µA
I_{bckdrv}	Backdrive current	Backdrive current on VDD pin when that pin is at 0 V				
		CC1, CC2 = 5V	–10	-	10	µA
$I_{LIH,EN}$	HIGH-level input leakage current	VI=3.3V, applies to CC1, CC2	-	-	20	µA
$I_{LIL,EN}$	LOW-level input leakage current	VI=GND, Applies to CC1, CC2	–20	-	0	µA

All information provided in this document is subject to legal disclaimers.

11.2 USB PD and Type-C characteristics

Table 9. USB PD and Type-C AC/DC characteristics

Applicable across operating temperature and power supply ranges as per Section 10 (unless otherwise noted). Typical values are specified at 27 °C (unless otherwise noted).

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
USB PD normative specification						
$f_{Bitrate}$	Bit rate		270	300	330	Kbps
$t_{UnitInterval}$	unit interval		3.03	-	3.7	µs
$p_{BitRate}$	Maximum difference between the bit-rate during the payload and the reference bit-rate (The reference bit rate is the average bit rate of the last 32 bits of the preamble)	At the transmitter	-	-	0.25	%
$t_{InterFrameGap}$	Time from the end of last bit of a Frame until the start of the first bit of the next Preamble.		25	-	-	µs
$t_{StartDrive}$	Time before the start of the first bit of the Preamble when the transmitter shall start driving the line.		–1	-	1	µs
USB PD transmitter normative specification						
$t_{EndDriveBMC}$	Time to cease driving the line after the end of the last bit of the Frame.	Min value is limited by $t_{HoldLowBMC}$	-	-	23	µs
t_{Fall}	Fall time	10 % and 90 % amplitude points, minimum is under unloaded condition	300	-	-	ns
$t_{HoldLowBMC}$	Time to cease driving the line after the final high-to-low transition	Max value is limited by $t_{EndDriveBMC}$	1	-	-	us
t_{Rise}	Rise time	10 % and 90 % amplitude points, minimum is under unloaded condition	300	-	-	ns
v_{Swing}	Voltage swing		1.05	1.125	1.2	V
z_{Driver}	Transmitter output impedance	Source output impedance at the Nyquist frequency of [USB2.0] low speed (750 kHz) while the source is driving the CC line.	33	-	75	Ω
USB PD receiver normative specification						
$c_{Receiver}$	CC Receiver capacitance	The CC pin (DFP or UFP) capacitance when not transmitting on the line	200	-	600	pF
$n_{TransitionCount}$	Transitions for signal detect		3	-	-	
$t_{RxFilter}$	Time constant of Rx bandwidth limiting filter		100	-	-	ns
$t_{TransitionWindow}$	Time window for detecting non-idle		12	-	20	µs
z_{BmcRx}	Receiver Input Impedance		10	-	-	MΩ

Table 9. USB PD and Type-C AC/DC characteristics *…continued*

Applicable across operating temperature and power supply ranges as per Section 10 (unless otherwise noted). Typical values are specified at 27 °C (unless otherwise noted).

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
Type-C specification						
I_{pullup}	Current source for DFP pullup indication	Default current	64	80	96	µA
		1.5 A	166	180	194	µA
		3 A	314	330	346	µA
R_{pulldn}	Pulldown termination on UFP	After on-board calibration is completed	4.6	5.1	5.6	kΩ
z_{OPEN}	UFP CC termination	Applies to self-powered UFP to remain undetectable by DFP	126	-	-	kΩ
V_{CLAMPH}	High current mode clamp voltage	UFP mode; VDD = 0, VBUS = 0	0.85	-	2.18	V
V_{CLAMPM}	Medium current mode clamp voltage	UFP mode; VDD = 0, VBUS = 0	0.45	-	1.25	V
V_{CLAMPD}	Default current mode clamp voltage	UFP mode; VDD = 0, VBUS = 0	0.25	-	1.25	V
V_{TUM}	Medium current mode detection threshold	UFP mode	1.16	1.23	1.31	V
V_{TUS}	Standard current mode detection threshold	UFP mode	0.61	0.66	0.70	V
V_{TURa}	Powered Accessory (Ra) mode detection threshold	UFP mode	0.15	0.2	0.25	V
$V_{TDH,Ra}$	High current mode Ra detection threshold	DFP mode	0.75	0.8	0.85	V
$V_{TD,Rd}$	Rd detection threshold	DFP mode	2.45	2.6	2.75	V
$V_{TDM,Ra}$	Medium current mode Ra detection threshold	DFP mode	0.35	0.4	0.45	V
$V_{TDS,Ra}$	Standard current mode Ra detection threshold	DFP mode	0.15	0.2	0.25	V

11.3 VCONN switch characteristics

Table 10. VCONN switch characteristics

Applicable across operating temperature and power supply ranges as per Section 10 (unless otherwise noted). Typical values are specified at 27 °C (unless otherwise noted).

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{VCONN_IN}	VCONN_IN voltage		2.7	-	5.5	V
I_{VCONN_IN}	DC Current		-	-	1	A
R_{ON}	ON resistance		-	150	240	mΩ
C_{ON}	ON capacitance		-	450	-	pF
C_{OFF}	OFF Capacitance		-	250	-	pF
I_{inrush}	Inrush current	When VCONN switch is enabled; corresponding CCx pin voltage is zero; CC capacitance = 10 µF	-	-	150	mA

14. Soldering of SMD packages

This text provides a very brief insight into a complex technology. A more in-depth account of soldering ICs can be found in Application Note *AN10365 "Surface mount reflow soldering description"*.

14.1 Introduction to soldering

Soldering is one of the most common methods through which packages are attached to Printed Circuit Boards (PCBs), to form electrical circuits. The soldered joint provides both the mechanical and the electrical connection. There is no single soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and Surface Mount Devices (SMDs) are mixed on one printed wiring board; however, it is not suitable for fine pitch SMDs. Reflow soldering is ideal for the small pitches and high densities that come with increased miniaturization.

14.2 Wave and reflow soldering

Wave soldering is a joining technology in which the joints are made by solder coming from a standing wave of liquid solder. The wave soldering process is suitable for the following:

- Through-hole components
- Leaded or leadless SMDs, which are glued to the surface of the printed circuit board

Not all SMDs can be wave soldered. Packages with solder balls, and some leadless packages which have solder lands underneath the body, cannot be wave soldered. Also, leaded SMDs with leads having a pitch smaller than ~0.6 mm cannot be wave soldered, due to an increased probability of bridging.

The reflow soldering process involves applying solder paste to a board, followed by component placement and exposure to a temperature profile. Leaded packages, packages with solder balls, and leadless packages are all reflow solderable.

Key characteristics in both wave and reflow soldering are:

- Board specifications, including the board finish, solder masks and vias
- Package footprints, including solder thieves and orientation
- The moisture sensitivity level of the packages
- Package placement
- Inspection and repair
- Lead-free soldering versus SnPb soldering

14.3 Wave soldering

Key characteristics in wave soldering are:

- Process issues, such as application of adhesive and flux, clinching of leads, board transport, the solder wave parameters, and the time during which components are exposed to the wave
- Solder bath specifications, including temperature and impurities

All information provided in this document is subject to legal disclaimers.

© NXP Semiconductors N.V. 2017. All rights reserved.

14.4 Reflow soldering

Key characteristics in reflow soldering are:

- Lead-free versus SnPb soldering; note that a lead-free reflow process usually leads to higher minimum peak temperatures (see Figure 25) than a SnPb process, thus reducing the process window
- Solder paste printing issues including smearing, release, and adjusting the process window for a mix of large and small components on one board
- Reflow temperature profile; this profile includes preheat, reflow (in which the board is heated to the peak temperature) and cooling down. It is imperative that the peak temperature is high enough for the solder to make reliable solder joints (a solder paste characteristic). In addition, the peak temperature must be low enough that the packages and/or boards are not damaged. The peak temperature of the package depends on package thickness and volume and is classified in accordance with Table 19 and 20

Table 19. SnPb eutectic process (from J-STD-020D)

Package thickness (mm)	**Package reflow temperature (°C)**	
	Volume (mm^3)	
	< 350	**≥ 350**
< 2.5	235	220
≥ 2.5	220	220

Table 20. Lead-free process (from J-STD-020D)

Package thickness (mm)	**Package reflow temperature (°C)**		
	Volume (mm^3)		
	< 350	**350 to 2000**	**> 2000**
< 1.6	260	260	260
1.6 to 2.5	260	250	245
> 2.5	250	245	245

Moisture sensitivity precautions, as indicated on the packing, must be respected at all times.

Studies have shown that small packages reach higher temperatures during reflow soldering, see Figure 25.

19. Legal information

19.1 Data sheet status

Document status[1][2]	Product status[3]	Definition
Objective [short] data sheet	Development	This document contains data from the objective specification for product development.
Preliminary [short] data sheet	Qualification	This document contains data from the preliminary specification.
Product [short] data sheet	Production	This document contains the product specification.

[1] Please consult the most recently issued document before initiating or completing a design.

[2] The term 'short data sheet' is explained in section "Definitions".

[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL http://www.nxp.com.

19.2 Definitions

Draft — The document is a draft version only. The content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information.

Short data sheet — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

Product specification — The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

19.3 Disclaimers

Limited warranty and liability — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the *Terms and conditions of commercial sale* of NXP Semiconductors.

Right to make changes — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Suitability for use — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors and its suppliers accept no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

Applications — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

Limiting values — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

Terms and conditions of commercial sale — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at http://www.nxp.com/profile/terms, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

No offer to sell or license — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

All information provided in this document is subject to legal disclaimers.

© NXP Semiconductors N.V. 2017. All rights reserved.

Export control — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

Quick reference data — The Quick reference data is an extract of the product data given in the Limiting values and Characteristics sections of this document, and as such is not complete, exhaustive or legally binding.

Non-automotive qualified products — Unless this data sheet expressly states that this specific NXP Semiconductors product is automotive qualified, the product is not suitable for automotive use. It is neither qualified nor tested in accordance with automotive testing or application requirements. NXP Semiconductors accepts no liability for inclusion and/or use of non-automotive qualified products in automotive equipment or applications.

In the event that customer uses the product for design-in and use in automotive applications to automotive specifications and standards, customer (a) shall use the product without NXP Semiconductors' warranty of the product for such automotive applications, use and specifications, and (b) whenever customer uses the product for automotive applications beyond NXP Semiconductors' specifications such use shall be solely at customer's own risk, and (c) customer fully indemnifies NXP Semiconductors for any liability, damages or failed product claims resulting from customer design and use of the product for automotive applications beyond NXP Semiconductors' standard warranty and NXP Semiconductors' product specifications.

Translations — A non-English (translated) version of a document is for reference only. The English version shall prevail in case of any discrepancy between the translated and English versions.
