

SC16C752B

5 V, 2.2 V and 2.5 V dual UART, 5 Mbit/s (max.), with 64-byte FIFOs

Rev. 6 — 30 November 2010

Product data sheet

1. General description

The SC16C752B is a dual Universal Asynchronous Receiver/Transmitter (UART) with 64-byte FIFOs, automatic hardware/software flow control, and data rates up to 5 Mbit/s (3.3 V and 5 V). The SC16C752B offers enhanced features. It has a Transmission Control Register (TCR) that stores receiver FIFO threshold levels to start/stop transmission during hardware and software flow control. With the FIFO Rdy register, the software gets the status of TXRDYn/RXRDYn for all four ports in one access. On-chip status registers provide the user with error indications, operational status, and modem interface control. System interrupts may be tailored to meet user requirements. An internal loopback capability allows on-board diagnostics.

The UART transmits data, sent to it over the peripheral 8-bit bus, on the TXn signal and receives characters on the RXn signal. Characters can be programmed to be 5 bits, 6 bits, 7 bits, or 8 bits. The UART has a 64-byte receive FIFO and transmit FIFO and can be programmed to interrupt at different trigger levels. The UART generates its own desired baud rate based upon a programmable divisor and its input clock. It can transmit even, odd, or no parity and 1, 1.5, or 2 stop bits. The receiver can detect break, idle, or framing errors, FIFO overflow, and parity errors. The transmitter can detect FIFO underflow. The UART also contains a software interface for modem control operations, and has software flow control and hardware flow control capabilities.

The SC16C752B is available in plastic LQFP48 and HVQFN32 packages.

2. Features and benefits

- Pin compatible with SC16C2550 with additional enhancements
- Up to 5 Mbit/s baud rate (at 3.3 V and 5 V; at 2.5 V maximum baud rate is 3 Mbit/s)
- 64-byte transmit FIFO
- 64-byte receive FIFO with error flags
- Programmable and selectable transmit and receive FIFO trigger levels for DMA and interrupt generation
- Software/hardware flow control
 - ◆ Programmable Xon/Xoff characters
 - ◆ Programmable auto-RTS and auto-CTS
- Optional data flow resume by Xon any character
- DMA signalling capability for both received and transmitted data
- Supports 5 V, 3.3 V and 2.5 V operation

- 5 V tolerant on input only pins¹
- Software selectable baud rate generator
- Prescaler provides additional divide-by-4 function
- Industrial temperature range (–40 °C to +85 °C)
- Pin and software compatible with SC16C752, TL16C752
- Fast data bus access time
- Programmable Sleep mode
- Programmable serial interface characteristics
 - ◆ 5-bit, 6-bit, 7-bit, or 8-bit characters
 - ◆ Even, odd, or no parity bit generation and detection
 - ◆ 1, 1.5, or 2 stop bit generation
- False start bit detection
- Complete status reporting capabilities in both normal and Sleep mode
- Line break generation and detection
- Internal test and loopback capabilities
- Fully prioritized interrupt system controls
- Modem control functions ($\overline{\text{CTS}}$, $\overline{\text{RTS}}$, $\overline{\text{DSR}}$, $\overline{\text{DTR}}$, $\overline{\text{RI}}$, and $\overline{\text{CD}}$)

3. Ordering information

Table 1. Ordering information

| Type number | Package | | |
|---------------|---------|--|----------|
| | Name | Description | Version |
| SC16C752BIB48 | LQFP48 | plastic low profile quad flat package; 48 leads; body 7 × 7 × 1.4 mm | SOT313-2 |
| SC16C752BIBS | HVQFN32 | plastic thermal enhanced very thin quad flat package; no leads; 32 terminals; body 5 × 5 × 0.85 mm | SOT617-1 |

1. For data bus, D7 to D0, see [Table 24 "Limiting values"](#).

5. Pinning information

5.1 Pinning

Fig 2. Pin configuration for LQFP48

Fig 3. Pin configuration for HVQFN32

5.2 Pin description

Table 2. Pin description

| Symbol | Pin | | Type | Description |
|--------------------------|--------|---------|------|--|
| | LQFP48 | HVQFN32 | | |
| A0 | 28 | 19 | I | Address 0 select bit. Internal registers address selection. |
| A1 | 27 | 18 | I | Address 1 select bit. Internal registers address selection. |
| A2 | 26 | 17 | I | Address 2 select bit. Internal registers address selection. |
| $\overline{\text{CDA}}$ | 40 | - | I | Carrier Detect (active LOW). These inputs are associated with individual UART channels A and B. A logic LOW on these pins indicates that a carrier has been detected by the modem for that channel. The state of these inputs is reflected in the Modem Status Register (MSR). |
| $\overline{\text{CDB}}$ | 16 | - | I | |
| $\overline{\text{CSA}}$ | 10 | 8 | I | Chip Select (active LOW). These pins enable data transfers between the user CPU and the SC16C752B for the channel(s) addressed. Individual UART sections (A, B) are addressed by providing a logic LOW on the respective CSA and CSB pins. |
| $\overline{\text{CSB}}$ | 11 | 9 | I | |
| $\overline{\text{CTSA}}$ | 38 | 25 | I | Clear to Send (active LOW). These inputs are associated with individual UART channels A and B. A logic 0 (LOW) on the CTSn pins indicates the modem or data set is ready to accept transmit data from the SC16C752B. Status can be tested by reading MSR[4]. These pins only affect the transmit and receive operations when auto-CTS function is enabled via the Enhanced Feature Register EFR[7] for hardware flow control operation. |
| $\overline{\text{CTSB}}$ | 23 | 16 | I | |
| D0 | 44 | 27 | I/O | Data bus (bidirectional). These pins are the 8-bit, 3-state data bus for transferring information to or from the controlling CPU. D0 is the least significant bit and the first data bit in a transmit or receive serial data stream. |
| D1 | 45 | 28 | I/O | |
| D2 | 46 | 29 | I/O | |
| D3 | 47 | 30 | I/O | |
| D4 | 48 | 31 | I/O | |
| D5 | 1 | 32 | I/O | |
| D6 | 2 | 1 | I/O | |
| D7 | 3 | 2 | I/O | |
| $\overline{\text{DSRA}}$ | 39 | - | I | Data Set Ready (active LOW). These inputs are associated with individual UART channels A and B. A logic 0 (LOW) on these pins indicates the modem or data set is powered-on and is ready for data exchange with the UART. The state of these inputs is reflected in the Modem Status Register (MSR). |
| $\overline{\text{DSRB}}$ | 20 | - | I | |
| $\overline{\text{DTRA}}$ | 34 | - | O | Data Terminal Ready (active LOW). These outputs are associated with individual UART channels A and B. A logic 0 (LOW) on these pins indicates that the SC16C752B is powered-on and ready. These pins can be controlled via the modem control register. Writing a logic 1 to MCR[0] will set the $\overline{\text{DTRn}}$ output to logic 0 (LOW), enabling the modem. The output of these pins will be a logic 1 after writing a logic 0 to MCR[0], or after a reset. |
| $\overline{\text{DTRB}}$ | 35 | - | O | |
| GND | 17 | 13 | I | Signal and power ground |
| INTA | 30 | 21 | O | Interrupt A and B (active HIGH). These pins provide individual channel interrupts INTA and INTB. INTA and INTB are enabled when MCR[3] is set to a logic 1, interrupt sources are enabled in the Interrupt Enable Register (IER). Interrupt conditions include: receiver errors, available receiver buffer data, available transmit buffer space, or when a modem status flag is detected. INTA, INTB are in the high-impedance state after reset. |
| INTB | 29 | 20 | O | |
| $\overline{\text{IOR}}$ | 19 | 14 | I | Input/Output Read strobe (active LOW). A HIGH-to-LOW transition on $\overline{\text{IOR}}$ will load the contents of an internal register defined by address bits A0 to A2 onto the SC16C752B data bus (D0 to D7) for access by external CPU. |

Table 2. Pin description ...continued

| Symbol | Pin | | Type | Description |
|----------------------------|----------------|---------|------|--|
| | LQFP48 | HVQFN32 | | |
| $\overline{\text{IOW}}$ | 15 | 12 | I | Input/Output Write strobe (active LOW). A LOW-to-HIGH transition on $\overline{\text{IOW}}$ will transfer the contents of the data bus (D0 to D7) from the external CPU to an internal register that is defined by address bits A0 to A2 and $\overline{\text{CSA}}$ and $\overline{\text{CSB}}$. |
| n.c. | 12, 24, 25, 37 | - | - | not connected |
| $\overline{\text{OPA}}$ | 32 | 22 | O | User defined outputs. This function is associated with individual channels A and B. The state of these pins is defined by the user through the software settings of MCR[3]. INTA-INTB are set to active mode and OPA-OPB to a logic 0 when MCR[3] is set to a logic 1. INTA-INTB are set to the 3-state mode and OPA-OPB to a logic 1 when MCR[3] is set to a logic 0. The output of these two pins is HIGH after reset. |
| $\overline{\text{OPB}}$ | 9 | 7 | O | |
| RESET | 36 | 24 | I | Reset. This pin will reset the internal registers and all the outputs. The UART transmitter output and the receiver input will be disabled during reset time. RESET is an active HIGH input. |
| $\overline{\text{RIA}}$ | 41 | - | I | Ring Indicator (active LOW). These inputs are associated with individual UART channels, A and B. A logic 0 on these pins indicates the modem has received a ringing signal from the telephone line. A LOW-to-HIGH transition on these input pins generates a modem status interrupt, if enabled. The state of these inputs is reflected in the Modem Status Register (MSR). |
| $\overline{\text{RIB}}$ | 21 | - | I | |
| $\overline{\text{RTSA}}$ | 33 | 23 | O | Request to Send (active LOW). These outputs are associated with individual UART channels, A and B. A logic 0 on the RTSn pin indicates the transmitter has data ready and waiting to send. Writing a logic 1 in the modem control register MCR[1] will set this pin to a logic 0, indicating data is available. After a reset these pins are set to a logic 1. These pins only affect the transmit and receive operations when auto-RTS function is enabled via the Enhanced Feature Register (EFR[6]) for hardware flow control operation. |
| $\overline{\text{RTSB}}$ | 22 | 15 | O | |
| RXA | 5 | 4 | I | Receive data input. These inputs are associated with individual serial channel data to the SC16C752B. During the local Loopback mode, these RXn input pins are disabled and transmit data is connected to the UART receive input internally. |
| RXB | 4 | 3 | I | |
| $\overline{\text{RXRDYA}}$ | 31 | - | O | Receive Ready (active LOW). $\overline{\text{RXRDYA}}$ or $\overline{\text{RXRDYB}}$ goes LOW when the trigger level has been reached or the FIFO has at least one character. It goes HIGH when the receive FIFO is empty. |
| $\overline{\text{RXRDYB}}$ | 18 | - | O | |
| TXA | 7 | 5 | O | Transmit data A, B. These outputs are associated with individual serial transmit channel data from the SC16C752B. During the local Loopback mode, the TXn output pin is disabled and transmit data is internally connected to the UART receive input. |
| TXB | 8 | 6 | O | |
| $\overline{\text{TXRDYA}}$ | 43 | - | O | Transmit Ready (active LOW). $\overline{\text{TXRDYA}}$ or $\overline{\text{TXRDYB}}$ go LOW when there are at least a trigger level number of spaces available or when the FIFO is empty. It goes HIGH when the FIFO is full or not empty. |
| $\overline{\text{TXRDYB}}$ | 6 | - | O | |
| V _{CC} | 42 | 26 | I | Power supply input |
| XTAL1 | 13 | 10 | I | Crystal or external clock input. Functions as a crystal input or as an external clock input. A crystal can be connected between XTAL1 and XTAL2 to form an internal oscillator circuit (see Figure 13). Alternatively, an external clock can be connected to this pin to provide custom data rates. |
| XTAL2 | 14 | 11 | O | Output of the crystal oscillator or buffered clock. (See also XTAL1.) XTAL2 is used as a crystal oscillator output or a buffered clock output. |

6. Functional description

The SC16C752B UART is pin-compatible with the SC16C2550 UART. It provides more enhanced features. All additional features are provided through a special Enhanced Feature Register (EFR).

The UART will perform serial-to-parallel conversion on data characters received from peripheral devices or modems, and parallel-to-parallel conversion on data characters transmitted by the processor. The complete status of each channel of the SC16C752B UART can be read at any time during functional operation by the processor.

The SC16C752B can be placed in an alternate mode (FIFO mode) relieving the processor of excessive software overhead by buffering received/transmitted characters. Both the receiver and transmitter FIFOs can store up to 64 bytes (including three additional bits of error status per byte for the receiver FIFO) and have selectable or programmable trigger levels. Primary outputs $\overline{\text{RXRDYn}}$ and $\overline{\text{TXRDYn}}$ allow signalling of DMA transfers.

The SC16C752B has selectable hardware flow control and software flow control. Hardware flow control significantly reduces software overhead and increases system efficiency by automatically controlling serial data flow using the $\overline{\text{RTSn}}$ output and $\overline{\text{CTS}}$ input signals. Software flow control automatically controls data flow by using programmable Xon/Xoff characters.

The UART includes a programmable baud rate generator that can divide the timing reference clock input by a divisor between 1 and $(2^{16} - 1)$.

6.1 Trigger levels

The SC16C752B provides independent selectable and programmable trigger levels for both receiver and transmitter DMA and interrupt generation. After reset, both transmitter and receiver FIFOs are disabled and so, in effect, the trigger level is the default value of one byte. The selectable trigger levels are available via the FIFO Control Register (FCR). The programmable trigger levels are available via the Trigger Level Register (TLR).

6.2 Hardware flow control

Hardware flow control is comprised of auto- $\overline{\text{CTS}}$ and auto- $\overline{\text{RTS}}$. Auto- $\overline{\text{CTS}}$ and auto- $\overline{\text{RTS}}$ can be enabled/disabled independently by programming EFR[7:6].

With auto- $\overline{\text{CTS}}$, $\overline{\text{CTS}}$ must be active before the UART can transmit data.

Auto- $\overline{\text{RTS}}$ only activates the $\overline{\text{RTSn}}$ output when there is enough room in the FIFO to receive data and de-activates the $\overline{\text{RTSn}}$ output when the receive FIFO is sufficiently full. The halt and resume trigger levels in the TCR determine the levels at which $\overline{\text{RTSn}}$ is activated/deactivated.

If both auto- $\overline{\text{CTS}}$ and auto- $\overline{\text{RTS}}$ are enabled, when $\overline{\text{RTSn}}$ is connected to $\overline{\text{CTS}}$, data transmission does not occur unless the receiver FIFO has empty space. Thus, overrun errors are eliminated during hardware flow control. If not enabled, overrun errors occur if the transmit data rate exceeds the receive FIFO servicing latency.

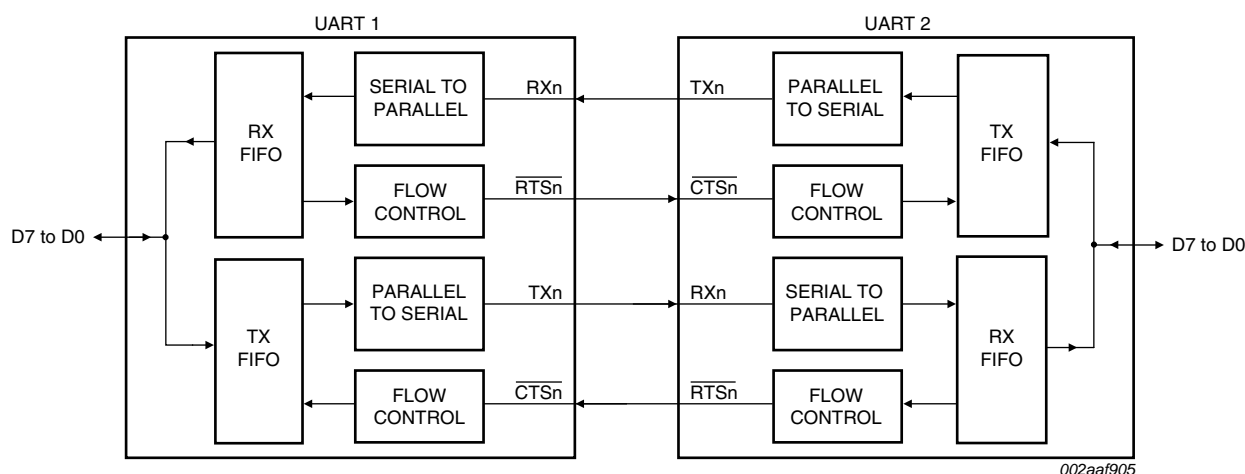

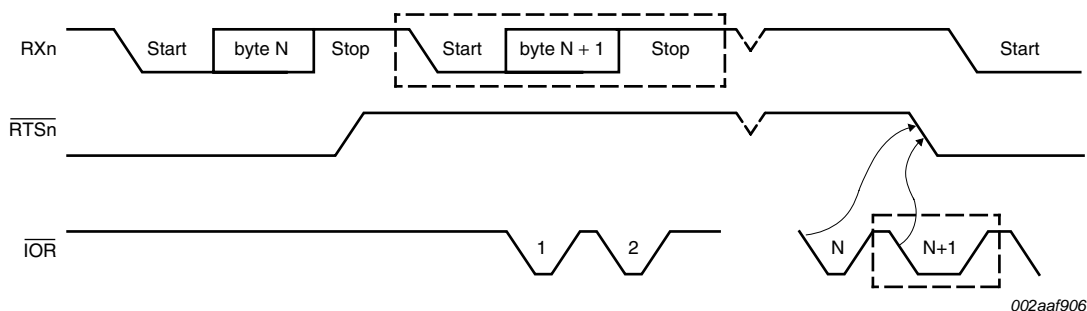

Fig 4. Auto flow control (auto-RTS and auto-CTS) example

6.2.1 Auto-RTS

Auto-RTS data flow control originates in the receiver block (see [Figure 1 “Block diagram” on page 3](#)). [Figure 5](#) shows $\overline{\text{RTS}}_n$ functional timing. The receiver FIFO trigger levels used in auto-RTS are stored in the TCR. $\overline{\text{RTS}}_n$ is active if the RX FIFO level is below the halt trigger level in TCR[3:0]. When the receiver FIFO halt trigger level is reached, $\overline{\text{RTS}}_n$ is de-asserted. The sending device (e.g., another UART) may send an additional byte after the trigger level is reached (assuming the sending UART has another byte to send) because it may not recognize the de-assertion of $\overline{\text{RTS}}_n$ until it has begun sending the additional byte. $\overline{\text{RTS}}_n$ is automatically reasserted once the receiver FIFO reaches the resume trigger level programmed via TCR[7:4]. This re-assertion allows the sending device to resume transmission.

N = receiver FIFO trigger level.

The two blocks in dashed lines cover the case where an additional byte is sent, as described in [Section 6.2.1](#).

Fig 5. RTS functional timing

6.2.2 Auto- $\overline{\text{CTS}}$

The transmitter circuitry checks $\overline{\text{CTS}}$ before sending the next data byte. When $\overline{\text{CTS}}$ is active, the transmitter sends the next byte. To stop the transmitter from sending the following byte, $\overline{\text{CTS}}$ must be de-asserted before the middle of the last stop bit that is currently being sent. The auto- $\overline{\text{CTS}}$ function reduces interrupts to the host system. When flow control is enabled, $\overline{\text{CTS}}$ level changes do not trigger host interrupts because the device automatically controls its own transmitter. Without auto- $\overline{\text{CTS}}$, the transmitter sends any data present in the transmit FIFO and a receiver overrun error may result.

When $\overline{\text{CTS}}$ is LOW, the transmitter keeps sending serial data out.

When $\overline{\text{CTS}}$ goes HIGH before the middle of the last stop bit of the current byte, the transmitter finishes sending the current byte, but it does not send the next byte.

When $\overline{\text{CTS}}$ goes from HIGH to LOW, the transmitter begins sending data again.

Fig 6. $\overline{\text{CTS}}$ functional timing

6.3 Software flow control

Software flow control is enabled through the enhanced feature register and the modem control register. Different combinations of software flow control can be enabled by setting different combinations of EFR[3:0]. Table 3 shows software flow control options.

Table 3. Software flow control options (EFR[0:3])

| EFR[3] | EFR[2] | EFR[1] | EFR[0] | TX, RX software flow controls |
|--------|--------|--------|--------|---|
| 0 | 0 | X | X | no transmit flow control |
| 1 | 0 | X | X | transmit Xon1, Xoff1 |
| 0 | 1 | X | X | transmit Xon2, Xoff2 |
| 1 | 1 | X | X | transmit Xon1, Xon2, Xoff1, Xoff2 |
| X | X | 0 | 0 | no receive flow control |
| X | X | 1 | 0 | receiver compares Xon1, Xoff1 |
| X | X | 0 | 1 | receiver compares Xon2, Xoff2 |
| 1 | 0 | 1 | 1 | transmit Xon1, Xoff1 receiver compares Xon1 and Xon2, Xoff1 and Xoff2 |
| 0 | 1 | 1 | 1 | transmit Xon2, Xoff2 receiver compares Xon1 and Xon2, Xoff1 and Xoff2 |
| 1 | 1 | 1 | 1 | transmit Xon1, Xon2, Xoff1, Xoff2 receiver compares Xon1 and Xon2, Xoff1 and Xoff2 |

There are two other enhanced features relating to software flow control:

- **Xon Any function (MCR[5]):** Operation will resume after receiving any character after recognizing the Xoff character. It is possible that an Xon1 character is recognized as an Xon Any character, which could cause an Xon2 character to be written to the receive FIFO.
- **Special character (EFR[5]):** Incoming data is compared to Xoff2. Detection of the special character sets the Xoff interrupt (IIR[4]) but does not halt transmission. The Xoff interrupt is cleared by a read of the IIR. The special character is transferred to the receive FIFO.

6.3.1 Receive flow control

When software flow control operation is enabled, the SC16C752B will compare incoming data with Xoff1/Xoff2 programmed characters (in certain cases, Xoff1 and Xoff2 must be received sequentially). When the correct Xoff character are received, transmission is halted after completing transmission of the current character. Xoff detection also sets IIR[4] (if enabled via IER[5]) and causes INTA/INTB to go HIGH.

To resume transmission, an Xon1/Xon2 character must be received (in certain cases Xon1 and Xon2 must be received sequentially). When the correct Xon characters are received, IIR[4] is cleared, and the Xoff interrupt disappears.

6.3.2 Transmit flow control

Xoff1/Xoff2 character is transmitted when the receive FIFO has passed the **halt** trigger level programmed in TCR[3:0].

Xon1/Xon2 character is transmitted when the receive FIFO reaches the **resume** trigger level programmed in TCR[7:4].

The transmission of Xoff/Xon(s) follows the exact same protocol as transmission of an ordinary byte from the FIFO. This means that even if the word length is set to be 5, 6, or 7 characters, then the 5, 6, or 7 least significant bits of Xoff1/Xoff2, Xon1/Xoff2 will be transmitted. (Note that the transmission of 5 bits, 6 bits, or 7 bits of a character is seldom done, but this functionality is included to maintain compatibility with earlier designs.)

It is assumed that software flow control and hardware flow control will never be enabled simultaneously. [Figure 7](#) shows an example of software flow control.

6.3.3 Software flow control example

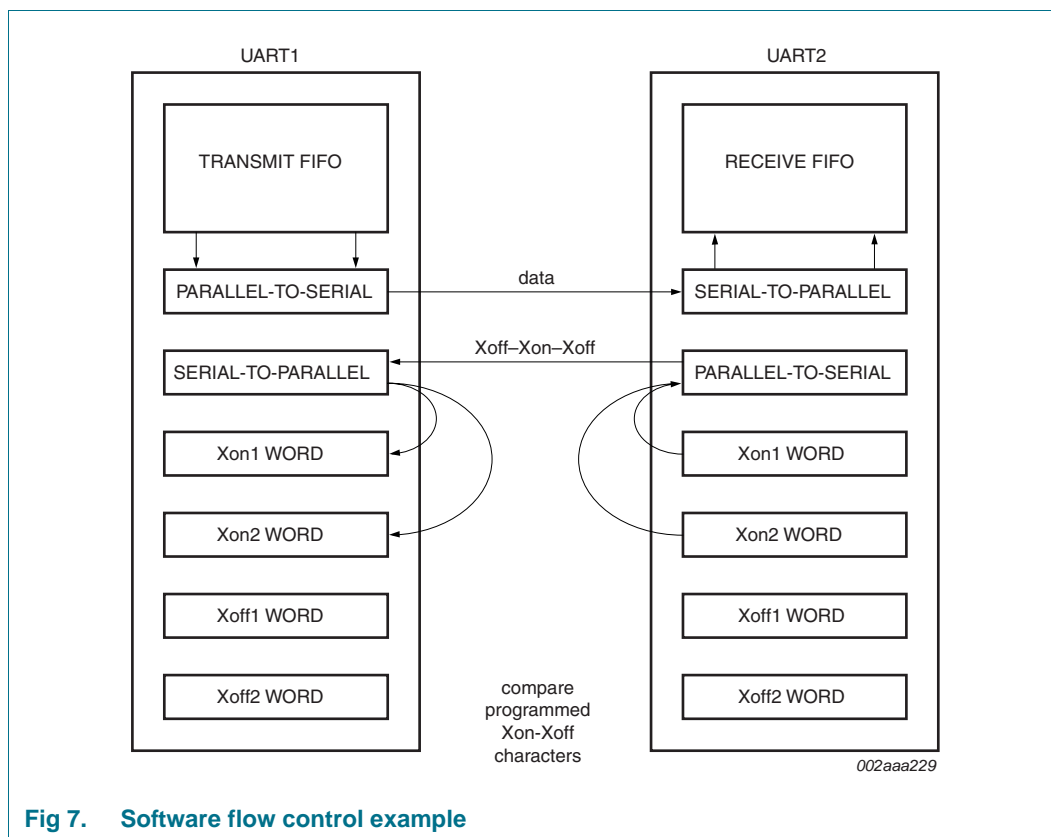

Fig 7. Software flow control example

6.3.3.1 Assumptions

UART1 is transmitting a large text file to UART2. Both UARTs are using software flow control with single character Xoff (0Fh) and Xon (0Dh) tokens. Both have Xoff threshold (TCR[3:0] = Fh) set to 60, and Xon threshold (TCR[7:4] = 8h) set to 32. Both have the interrupt receive threshold (TLR[7:4] = Dh) set to 52.

UART 1 begins transmission and sends 52 characters, at which point UART2 will generate an interrupt to its processor to service the receive FIFO, but assume the interrupt latency is fairly long. UART1 will continue sending characters until a total of 60 characters have been sent. At this time, UART2 will transmit a 0Fh to UART1, informing UART1 to halt transmission. UART1 will likely send the 61st character while UART2 is sending the Xoff character. Now UART2 is serviced and the processor reads enough data out of the receive FIFO that the level drops to 32. UART2 will now send a 0Dh to UART1, informing UART1 to resume transmission.

6.4 Reset

[Table 4](#) summarizes the state of register after reset.

Table 4. Register reset functions^[1]

| Register | Reset control | Reset state |
|-----------------------------------|---------------|--|
| Interrupt Enable Register | RESET | all bits cleared |
| Interrupt Identification Register | RESET | bit 0 is set; all other bits cleared |
| FIFO Control Register | RESET | all bits cleared |
| Line Control Register | RESET | reset to 0001 1101 (1Dh) |
| Modem Control Register | RESET | all bits cleared |
| Line Status Register | RESET | bit 5 and bit 6 set; all other bits cleared |
| Modem Status Register | RESET | bits [3:0] cleared; bits [7:4] input signals |
| Enhanced Feature Register | RESET | all bits cleared |
| Receiver Holding Register | RESET | pointer logic cleared |
| Transmitter Holding Register | RESET | pointer logic cleared |
| Transmission Control Register | RESET | all bits cleared |
| Trigger Level Register | RESET | all bits cleared |

[1] Registers DLL, DLM, SPR, XON1, XON2, XOFF1, XOFF2 are not reset by the top-level reset signal RESET, i.e., they hold their initialization values during reset.

[Table 5](#) summarizes the state of registers after reset.

Table 5. Signal RESET functions

| Signal | Reset control | Reset state |
|--------------------|---------------|-------------|
| TX _n | RESET | HIGH |
| RTS _n | RESET | HIGH |
| DTR _n | RESET | HIGH |
| RXRDY _n | RESET | HIGH |
| TXRDY _n | RESET | LOW |

6.5 Interrupts

The SC16C752B has interrupt generation and prioritization (six prioritized levels of interrupts) capability. The Interrupt Enable Register (IER) enables each of the six types of interrupts and the INTA/INTB signal in response to an interrupt generation. The IER can also disable the interrupt system by clearing bit 0 to bit 3 and bit 5 to bit 7. When an interrupt is generated, the IIR indicates that an interrupt is pending and provides the type of interrupt through IIR[5:0]. [Table 6](#) summarizes the interrupt control functions.

Table 6. Interrupt control functions

| IIR[5:0] | Priority level | Interrupt type | Interrupt source | Interrupt reset method |
|----------|----------------|----------------------|--|---|
| 00 0001 | None | none | none | none |
| 00 0110 | 1 | receiver line status | OE, FE, PE, or BI errors occur in characters in the RX FIFO | FE, PE, BI: all erroneous characters are read from the RX FIFO. OE: read LSR |
| 00 1100 | 2 | RX time-out | stale data in RX FIFO | read RHR |
| 00 0100 | 2 | RHR interrupt | DRDY (data ready) (FIFO disable) RX FIFO above trigger level (FIFO enable) | read RHR |
| 00 0010 | 3 | THR interrupt | TFE (THR empty) (FIFO disable) TX FIFO passes above trigger level (FIFO enable) | read IIR or a write to the THR |
| 00 0000 | 4 | modem status | MSR[3:0] = logic 0 | read MSR |
| 01 0000 | 5 | Xoff interrupt | receive Xoff character(s)/special character | receive Xon character(s)/Read of IIR |
| 10 0000 | 6 | CTS, RTS | RTSn pin or CTSn pin change state from active (LOW) to inactive (HIGH) | read IIR |

It is important to note that for the framing error, parity error, and break conditions, LSR[7] generates the interrupt. LSR[7] is set when there is an error anywhere in the RX FIFO, and is cleared only when there are no more errors remaining in the FIFO. LSR[4:2] always represent the error status for the received character at the top of the RX FIFO. Reading the RX FIFO updates LSR[4:2] to the appropriate status for the new character at the top of the FIFO. If the RX FIFO is empty, then LSR[4:2] are all zeros.

For the Xoff interrupt, if an Xoff flow character detection caused the interrupt, the interrupt is cleared by an Xon flow character detection. If a special character detection caused the interrupt, the interrupt is cleared by a read of the LSR.

6.5.1 Interrupt mode operation

In interrupt mode (if any bit of IER[3:0] is 1) the processor is informed of the status of the receiver and transmitter by an interrupt signal, INTA/INTB. Therefore, it is not necessary to continuously poll the Line Status Register (LSR) to see if any interrupt needs to be serviced. [Figure 8](#) shows interrupt mode operation.

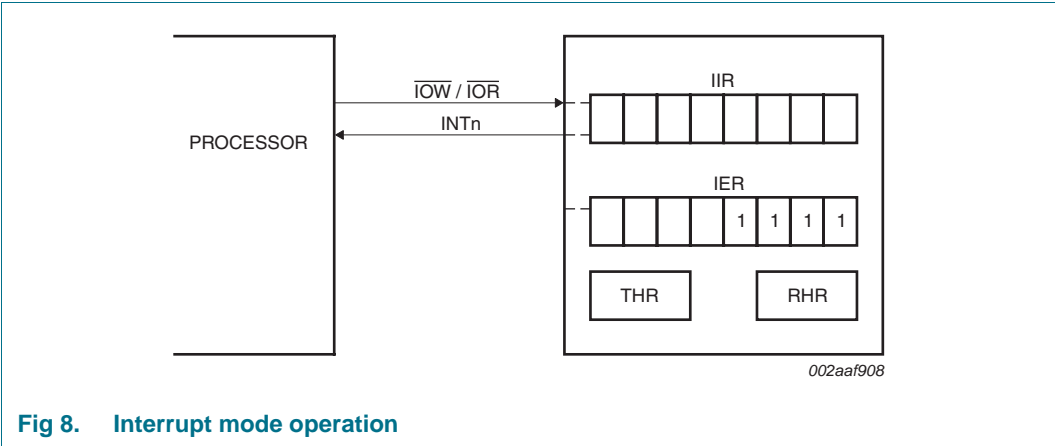

Fig 8. Interrupt mode operation

6.5.2 Polled mode operation

In polled mode (IER[3:0] = 0000) the status of the receiver and transmitter can be checked by polling the Line Status Register (LSR). This mode is an alternative to the FIFO interrupt mode of operation where the status of the receiver and transmitter is automatically known by means of interrupts sent to the CPU. [Figure 9](#) shows FIFO polled mode operation.

Fig 9. FIFO polled mode operation

6.6 DMA operation

There are two modes of DMA operation, DMA mode 0 or DMA mode 1, selected by FCR[3].

In DMA mode 0 or FIFO disable (FCR[0] = 0) DMA occurs in single character transfers. In DMA mode 1, multi-character (or block) DMA transfers are managed to relieve the processor for longer periods of time.

6.6.1 Single DMA transfers (DMA mode 0/FIFO disable)

Figure 10 shows $\overline{\text{TXRDYn}}$ and $\overline{\text{RXRDYn}}$ in DMA mode 0/FIFO disable.

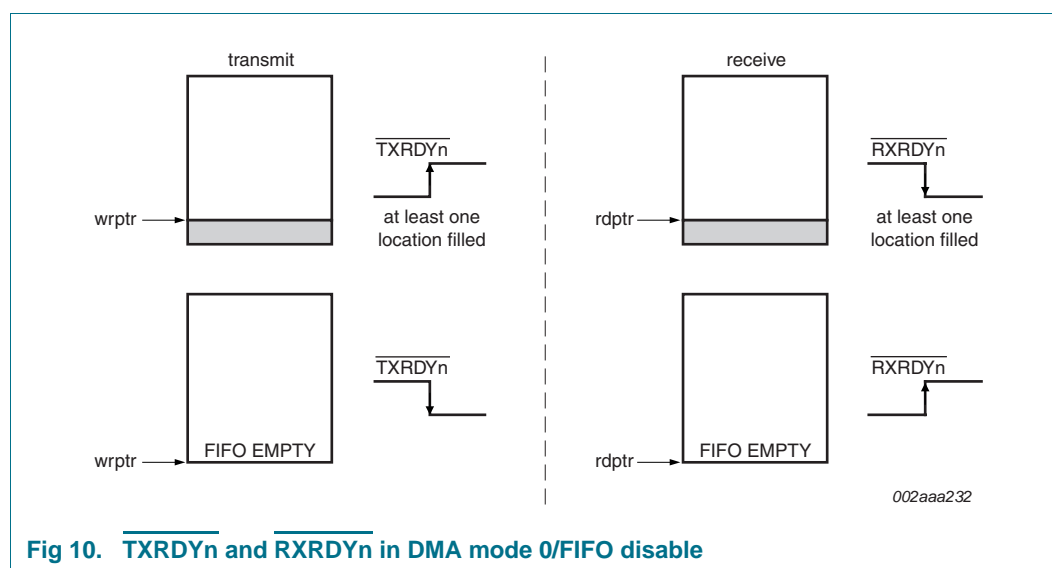

Fig 10. $\overline{\text{TXRDYn}}$ and $\overline{\text{RXRDYn}}$ in DMA mode 0/FIFO disable

6.6.1.1 Transmitter

When empty, the $\overline{\text{TXRDYn}}$ signal becomes active. $\overline{\text{TXRDYn}}$ will go inactive after one character has been loaded into it.

6.6.1.2 Receiver

$\overline{\text{RXRDYn}}$ is active when there is at least one character in the FIFO. It becomes inactive when the receiver is empty.

6.6.2 Block DMA transfers (DMA mode 1)

Figure 11 shows $\overline{\text{TXRDYn}}$ and $\overline{\text{RXRDYn}}$ in DMA mode 1.

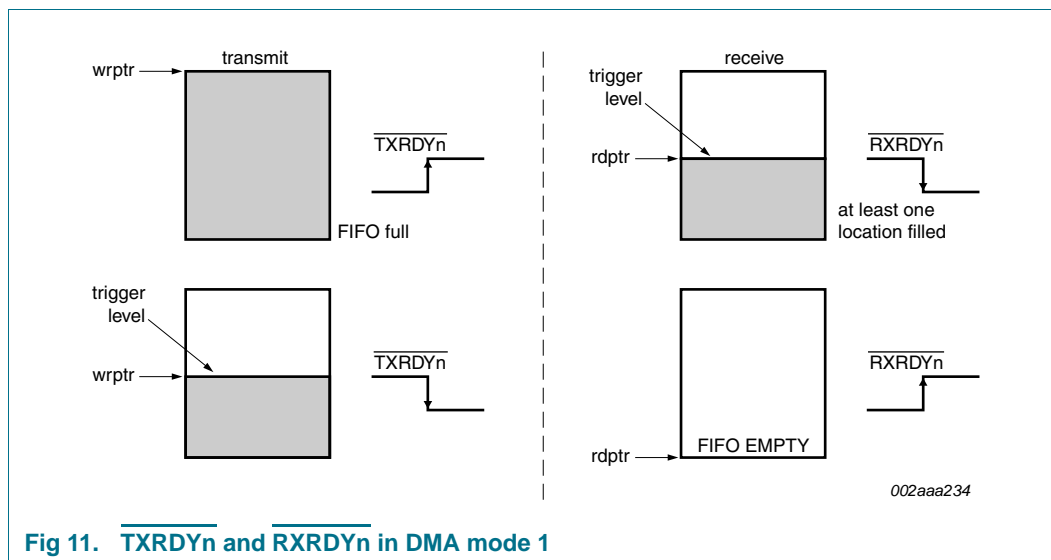

Fig 11. $\overline{\text{TXRDYn}}$ and $\overline{\text{RXRDYn}}$ in DMA mode 1

6.6.2.1 Transmitter

$\overline{\text{TXRDYn}}$ is active when there is a trigger level number of spaces available. It becomes inactive when the FIFO is full.

6.6.2.2 Receiver

$\overline{\text{RXRDYn}}$ becomes active when the trigger level has been reached, or when a time-out interrupt occurs. It will go inactive when the FIFO is empty or an error in the receive FIFO is flagged by LSR[7].

6.7 Sleep mode

Sleep mode is an enhanced feature of the SC16C752B UART. It is enabled when EFR[4], the enhanced functions bit, is set **and** when IER[4] is set. Sleep mode is entered when:

- The serial data input line, RXn, is idle (see [Section 6.8 “Break and time-out conditions”](#)).
- The transmit FIFO and transmit shift register are empty.
- There are no interrupts pending except THR and time-out interrupts.

Remark: Sleep mode will **not** be entered if there is data in the receive FIFO.

In Sleep mode, the UART clock and baud rate clock are stopped. Since most registers are clocked using these clocks, the power consumption is greatly reduced. The UART will wake up when any change is detected on the RXn line, when there is any change in the state of the modem input pins, or if data is written to the transmit FIFO.

Remark: Writing to the divisor latches DLL and DLM to set the baud clock must not be done during Sleep mode. Therefore, it is advisable to disable Sleep mode using IER[4] before writing to DLL or DLM.

6.8 Break and time-out conditions

An RX idle condition is detected when the receiver line, RXn, has been HIGH for 4 character time. The receiver line is sampled midway through each bit.

When a break condition occurs, the TXn line is pulled LOW. A break condition is activated by setting LCR[6].

6.9 Programmable baud rate generator

The SC16C752B UART contains a programmable baud generator that takes any clock input and divides it by a divisor in the range between 1 and $(2^{16} - 1)$. An additional divide-by-4 prescaler is also available and can be selected by MCR[7], as shown in [Figure 12](#). The output frequency of the baud rate generator is $16 \times$ the baud rate. The formula for the divisor is given in [Equation 1](#):

$$\text{divisor} = \frac{\left(\frac{\text{XTAL1 crystal input frequency}}{\text{prescaler}} \right)}{(\text{desired baud rate} \times 16)} \quad (1)$$

Where:

prescaler = 1, when MCR[7] is set to logic 0 after reset (divide-by-1 clock selected);

prescaler = 4, when MCR[7] is set to logic 1 after reset (divide-by-4 clock selected).

Remark: The default value of prescaler after reset is divide-by-1.

[Figure 12](#) shows the internal prescaler and baud rate generator circuitry.

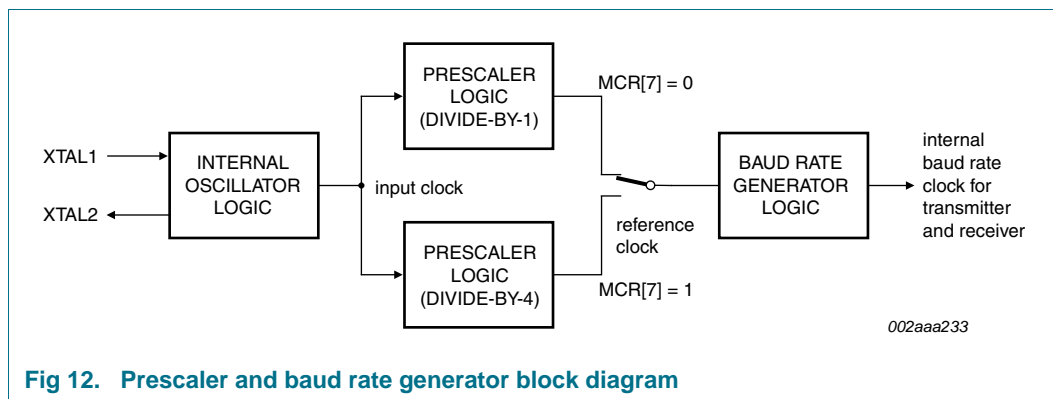

Fig 12. Prescaler and baud rate generator block diagram

DLL and DLM must be written to in order to program the baud rate. DLL and DLM are the least significant and most significant byte of the baud rate divisor. If DLL and DLM are both zero, the UART is effectively disabled, as no baud clock will be generated.

Remark: The programmable baud rate generator is provided to select both the transmit and receive clock rates.

[Table 7](#) and [Table 8](#) show the baud rate and divisor correlation for crystal with frequency 1.8432 MHz and 3.072 MHz, respectively.

[Figure 13](#) shows the crystal clock circuit reference.

Table 7. Baud rates using a 1.8432 MHz crystal

| Desired baud rate | Divisor used to generate 16× clock | Percent error difference between desired and actual |
|-------------------|---------------------------------------|--|

7. Register descriptions

Each register is selected using address lines A0, A1, A2, and in some cases, bits from other registers. The programming combinations for register selection are shown in [Table 9](#).

Table 9. Register map - read/write properties

| A2 | A1 | A0 | Read mode | Write mode |
|----|----|----|---|---|
| 0 | 0 | 0 | Receive Holding Register (RHR) | Transmit Holding Register (THR) |
| 0 | 0 | 1 | Interrupt Enable Register (IER) | Interrupt Enable Register |
| 0 | 1 | 0 | Interrupt Identification Register (IIR) | FIFO Control Register (FCR) |
| 0 | 1 | 1 | Line Control Register (LCR) | Line Control Register |
| 1 | 0 | 0 | Modem Control Register (MCR) ^[1] | Modem Control Register ^[1] |
| 1 | 0 | 1 | Line Status Register (LSR) | |
| 1 | 1 | 0 | Modem Status Register (MSR) | |
| 1 | 1 | 1 | Scratchpad Register (SPR) | Scratchpad Register |
| 0 | 0 | 0 | Divisor Latch LSB (DLL) ^{[2][3]} | Divisor Latch LSB ^{[2][3]} |
| 0 | 0 | 1 | Divisor Latch MSB (DLM) ^{[2][3]} | Divisor Latch MSB ^{[2][3]} |
| 0 | 1 | 0 | Enhanced Feature Register (EFR) ^{[2][4]} | Enhanced Feature Register ^{[2][4]} |
| 1 | 0 | 0 | Xon1 word ^{[2][4]} | Xon1 word ^{[2][4]} |
| 1 | 0 | 1 | Xon2 word ^{[2][4]} | Xon2 word ^{[2][4]} |
| 1 | 1 | 0 | Xoff1 word ^{[2][4]} | Xoff1 word ^{[2][4]} |
| 1 | 1 | 1 | Xoff2 word ^{[2][4]} | Xoff2 word ^{[2][4]} |
| 1 | 1 | 0 | Transmission Control Register (TCR) ^{[2][5]} | Transmission Control Register ^{[2][5]} |
| 1 | 1 | 1 | Trigger Level Register (TLR) ^{[2][5]} | Trigger Level Register ^{[2][5]} |
| 1 | 1 | 1 | FIFO ready register ^{[2][6]} | |

[1] MCR[7] can only be modified when EFR[4] is set.

[2] Accessed by a combination of address pins and register bits.

[3] Accessible only when LCR[7] is logic 1.

[4] Accessible only when LCR is set to 1011 1111 (BFh).

[5] Accessible only when EFR[4] = logic 1 and MCR[6] = logic 1, i.e., EFR[4] and MCR[6] are read/write enables.

[6] Accessible only when $\overline{\text{CSA}}$ or $\overline{\text{CSB}}$ = logic 0, MCR[2] = logic 1, and loopback is disabled (MCR[4] = logic 0).

Table 10 lists and describes the SC16C752B internal registers.

Table 10. SC16C752B internal registers

| A2 | A1 | A0 | Register | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 | Read/Write |

| 1 | 1 | 1 | Xoff2 | bit 7 | bit 6 | bit 5 | bit 4 | bit 3 | bit 2 | bit 1 | bit 0 | R/W |

[1] These registers are accessible only when LCR[7] = logic 0.

[2] These bits can only be modified if register bit EFR[4] is enabled, i.e., if enhanced functions are enabled.

[3] The Special register set is accessible only when LCR[7] is set to a logic 1.

[4] Enhanced Feature Register; Xon1/Xon2 and Xoff1/Xoff2 are accessible only when LCR is set to BFh.

Remark: Refer to the notes under [Table 9](#) for more register access information.

7.1 Receiver Holding Register (RHR)

The receiver section consists of the Receiver Holding Register (RHR) and the Receiver Shift Register (RSR). The RHR is actually a 64-byte FIFO. The RSR receives serial data from the RX terminal. The data is converted to parallel data and moved to the RHR. The receiver section is controlled by the Line Control Register. If the FIFO is disabled, location zero of the FIFO is used to store the characters.

Remark: In this case, characters are overwritten if overflow occurs.

If overflow occurs, characters are lost. The RHR also stores the error status bits associated with each character.

7.2 Transmit Holding Register (THR)

The transmitter section consists of the Transmit Holding Register (THR) and the Transmit Shift Register (TSR). The THR is actually a 64-byte FIFO. The THR receives data and shifts it into the TSR, where it is converted to serial data and moved out on the TXn terminal. If the FIFO is disabled, the FIFO is still used to store the byte. Characters are lost if overflow occurs.

7.3 FIFO Control Register (FCR)

This is a write-only register that is used for enabling the FIFOs, clearing the FIFOs, setting transmitter and receiver trigger levels, and selecting the type of DMA signalling. [Table 11](#) shows FIFO control register bit settings.

Table 11. FIFO Control Register bits description

| Bit | Symbol | Description |
|-----|-------------------------------|---|
| 7:6 | FCR[7] (MSB), FCR[6] (LSB) | RX trigger. Sets the trigger level for the receive FIFO. 00 - 8 characters 01 - 16 characters 10 - 56 characters 11 - 60 characters |
| 5:4 | FCR[5] (MSB), FCR[4] (LSB) | TX trigger. Sets the trigger level for the transmit FIFO. 00 - 8 spaces 01 - 16 spaces 10 - 32 spaces 11 - 56 spaces FCR[5:4] can only be modified and enabled when EFR[4] is set. This is because the transmit trigger level is regarded as an enhanced function. |
| 3 | FCR[3] | DMA mode select. logic 0 = set DMA mode '0' logic 1 = set DMA mode '1' |
| 2 | FCR[2] | Reset transmit FIFO. logic 0 = no FIFO transmit reset (normal default condition) logic 1 = Clears the contents of the transmit FIFO and resets the FIFO counter logic (the transmit shift register is not cleared or altered). This bit will return to a logic 0 after clearing the FIFO. |
| 1 | FCR[1] | Reset receive FIFO. logic 0 = no FIFO receive reset (normal default condition) logic 1 = Clears the contents of the receive FIFO and resets the FIFO counter logic (the receive shift register is not cleared or altered). This bit will return to a logic 0 after clearing the FIFO. |
| 0 | FCR[0] | FIFO enable. logic 0 = disable the transmit and receive FIFO (normal default condition) logic 1 = enable the transmit and receive FIFO. |

7.4 Line Control Register (LCR)

This register controls the data communication format. The word length, number of stop bits, and parity type are selected by writing the appropriate bits to the LCR. [Table 12](#) shows the Line Control Register bit settings.

Table 12. Line Control Register bits description

| Bit | Symbol | Description |
|-----|----------|--|
| 7 | LCR[7] | Divisor latch enable. logic 0 = divisor latch disabled (normal default condition) logic 1 = divisor latch enabled |
| 6 | LCR[6] | Break control bit. When enabled, the Break control bit causes a break condition to be transmitted (the TXn output is forced to a logic 0 state). This condition exists until disabled by setting LCR[6] to a logic 0. logic 0 = no break condition (normal default condition) logic 1 = forces the transmitter output (TXn) to a logic 0 to alert the communication terminal to a line break condition |
| 5 | LCR[5] | Set parity. LCR[5] selects the forced parity format (if LCR[3] = 1). logic 0 = parity is not forced (normal default condition) LCR[5] = logic 1 and LCR[4] = logic 0: parity bit is forced to a logic 1 for the transmit and receive data. LCR[5] = logic 1 and LCR[4] = logic 1: parity bit is forced to a logic 0 for the transmit and receive data. |
| 4 | LCR[4] | Parity type select. logic 0 = odd parity is generated (if LCR[3] = 1) logic 1 = even parity is generated (if LCR[3] = 1) |
| 3 | LCR[3] | Parity enable. logic 0 = no parity (normal default condition) logic 1 = a parity bit is generated during transmission and the receiver checks for received parity |
| 2 | LCR[2] | Number of Stop bits. Specifies the number of stop bits. 0 - 1 stop bit (word length = 5, 6, 7, 8) 1 - 1.5 stop bits (word length = 5) 1 - 2 stop bits (word length = 6, 7, 8) |
| 1:0 | LCR[1:0] | Word length bits 1, 0. These two bits specify the word length to be transmitted or received. 00 - 5 bits 01 - 6 bits 10 - 7 bits 11 - 8 bits |

7.5 Line Status Register (LSR)

[Table 13](#) shows the Line Status Register bit settings.

Table 13. Line Status Register bits description

| Bit | Symbol | Description |
|-----|--------|---|
| 7 | LSR[7] | FIFO data error. logic 0 = no error (normal default condition) logic 1 = At least one parity error, framing error, or break indication is in the receiver FIFO. This bit is cleared when no more errors are present in the FIFO. |
| 6 | LSR[6] | THR and TSR empty. This bit is the Transmit Empty indicator. logic 0 = transmitter hold and shift registers are not empty logic 1 = transmitter hold and shift registers are empty |
| 5 | LSR[5] | THR empty. This bit is the Transmit Holding Register Empty indicator. logic 0 = Transmit Holding Register is not empty logic 1 = Transmit Holding Register is empty. The processor can now load up to 64 bytes of data into the THR if the transmit FIFO is enabled. |
| 4 | LSR[4] | Break interrupt. logic 0 = No break condition (normal default condition) logic 1 = A break condition occurred and associated byte is 00, i.e., RXn was LOW for one character time frame |
| 3 | LSR[3] | Framing error. logic 0 = no framing error in data being read from receive FIFO (normal default condition) logic 1 = framing error occurred in data being read from receive FIFO, i.e., received data did not have a valid stop bit. |
| 2 | LSR[2] | Parity error. logic 0 = no parity error (normal default condition) logic 1 = parity error in data being read from receive FIFO |
| 1 | LSR[1] | Overrun error. logic 0 = no overrun error (normal default condition) logic 1 = overrun error has occurred |
| 0 | LSR[0] | Data in receiver. logic 0 = no data in receive FIFO (normal default condition) logic 1 = at least one character in the receive FIFO |

When the LSR is read, LSR[4:2] reflect the error bits (BI, FE, PE) of the character at the top of the receive FIFO (next character to be read). The LSR[4:2] registers do not physically exist, as the data read from the receive FIFO is output directly onto the output data bus, DI[4:2], when the LSR is read. Therefore, errors in a character are identified by reading the LSR and then reading the RHR.

LSR[7] is set when there is an error anywhere in the receive FIFO, and is cleared only when there are no more errors remaining in the FIFO.

Reading the LSR does not cause an increment of the receive FIFO read pointer. The receive FIFO read pointer is incremented by reading the RHR.

7.6 Modem Control Register (MCR)

The MCR controls the interface with the mode, data set, or peripheral device that is emulating the modem. [Table 14](#) shows modem control register bit settings.

Table 14. Modem Control Register bits description

| Bit | Symbol | Description |
|-----|-----------------------|--|
| 7 | MCR[7] ^[1] | Clock select. logic 0 = divide-by-1 clock input logic 1 = divide-by-4 clock input |
| 6 | MCR[6] ^[1] | TCR and TLR enable. logic 0 = no action logic 1 = enable access to the TCR and TLR registers |
| 5 | MCR[5] ^[1] | Xon Any. logic 0 = disable Xon Any function logic 1 = enable Xon Any function |
| 4 | MCR[4] | Enable loopback. logic 0 = normal operating mode. logic 1 = enable local Loopback mode (internal). In this mode the MCR[3:0] signals are looped back into MSR[7:4] and the TXn output is looped back to the RXn input internally. |
| 3 | MCR[3] | IRQ enable OP. logic 0 = forces INTA, INTB outputs to the 3-state mode and OP output to HIGH state logic 1 = forces the INTA-INTB outputs to the active state and OP output to LOW state. In Loopback mode, controls MSR[7]. |
| 2 | MCR[2] | FIFO Ready enable. logic 0 = disable the FIFO Rdy register logic 1 = enable the FIFO Rdy register. In Loopback mode, controls MSR[6]. |
| 1 | MCR[1] | $\overline{\text{RTS}}$ logic 0 = force $\overline{\text{RTSn}}$ output to inactive (HIGH) logic 1 = force $\overline{\text{RTSn}}$ output to active (LOW). In loopback mode, controls MSR[4]. If auto-RTS is enabled, the RTSn output is controlled by hardware flow control. |
| 0 | MCR[0] | $\overline{\text{DTR}}$ logic 0 = force $\overline{\text{DTRn}}$ output to inactive (HIGH) logic 1 = force $\overline{\text{DTRn}}$ output to active (LOW). In Loopback mode, controls MSR[5]. |

[1] MCR[7:5] can only be modified when EFR[4] is set, i.e., EFR[4] is a write enable.

7.7 Modem Status Register (MSR)

This 8-bit register provides information about the current state of the control lines from the mode, data set, or peripheral device to the processor. It also indicates when a control input from the modem changes state. [Table 15](#) shows Modem Status Register bit settings per channel.

Table 15. Modem Status Register bits description

| Bit | Symbol | Description |
|-----|--------|---|
| 7 | MSR[7] | CD (active HIGH, logic 1) ^[1] . This bit is the complement of the $\overline{\text{CDn}}$ input during normal mode. During internal Loopback mode, it is equivalent to MCR[3]. |
| 6 | MSR[6] | RI (active HIGH, logic 1) ^[1] . This bit is the complement of the $\overline{\text{RIn}}$ input during normal mode. During internal Loopback mode, it is equivalent to MCR[2]. |
| 5 | MSR[5] | DSR (active HIGH, logic 1) ^[1] . This bit is the complement of the $\overline{\text{DSRn}}$ input during normal mode. During Internal Loopback mode, it is equivalent MCR[0]. |
| 4 | MSR[4] | CTS (active HIGH, logic 1) ^[1] . This bit is the complement of the $\overline{\text{CTSn}}$ input during normal mode. During internal Loopback mode, it is equivalent to MCR[1]. |
| 3 | MSR[3] | ΔCD . Indicates that $\overline{\text{CDn}}$ input (or MCR[3] in Loopback mode) has changed state. Cleared on a read. |
| 2 | MSR[2] | ΔRI . Indicates that $\overline{\text{RIn}}$ input (or MCR[2] in Loopback mode) has changed state from LOW to HIGH. Cleared on a read. |
| 1 | MSR[1] | ΔDSR . Indicates that $\overline{\text{DSRn}}$ input (or MCR[0] in Loopback mode) has changed state. Cleared on a read. |
| 0 | MSR[0] | ΔCTS . Indicates that $\overline{\text{CTSn}}$ input (or MCR[1] in Loopback mode) has changed state. Cleared on a read. |

[1] The primary inputs $\overline{\text{RIn}}$, $\overline{\text{CDn}}$, $\overline{\text{CTSn}}$, $\overline{\text{DSRn}}$ are all active LOW, but their registered equivalents in the MSR and MCR (in Loopback) registers are active HIGH.

7.8 Interrupt Enable Register (IER)

The Interrupt Enable Register (IER) enables each of the six types of interrupt, receiver error, RHR interrupt, THR interrupt, Xoff received, or $\overline{\text{CTS}}/\overline{\text{RTS}}$ change of state from LOW to HIGH. The INTA/INTB output signal is activated in response to interrupt generation. [Table 16](#) shows Interrupt Enable Register bit settings.

Table 16. Interrupt Enable Register bits description

| Bit | Symbol | Description |
|-----|-----------------------|---|
| 7 | IER[7] ^[1] | $\overline{\text{CTS}}$ interrupt enable. logic 0 = disable the $\overline{\text{CTS}}$ interrupt (normal default condition) logic 1 = enable the $\overline{\text{CTS}}$ interrupt |
| 6 | IER[6] ^[1] | $\overline{\text{RTS}}$ interrupt enable. logic 0 = disable the $\overline{\text{RTS}}$ interrupt (normal default condition) logic 1 = enable the $\overline{\text{RTS}}$ interrupt |
| 5 | IER[5] ^[1] | Xoff interrupt. logic 0 = disable the Xoff interrupt (normal default condition) logic 1 = enable the Xoff interrupt |
| 4 | IER[4] ^[1] | Sleep mode. logic 0 = disable Sleep mode (normal default condition) logic 1 = enable Sleep mode. See Section 6.7 "Sleep mode" for details. |
| 3 | IER[3] | Modem Status Interrupt. logic 0 = disable the Modem Status Register interrupt (normal default condition) logic 1 = enable the Modem Status Register interrupt |
| 2 | IER[2] | Receive Line Status interrupt. logic 0 = disable the receiver line status interrupt (normal default condition) logic 1 = enable the receiver line status interrupt |
| 1 | IER[1] | Transmit Holding Register interrupt. logic 0 = disable the THR interrupt (normal default condition) logic 1 = enable the THR interrupt |
| 0 | IER[0] | Receive Holding Register interrupt. logic 0 = disable the RHR interrupt (normal default condition) logic 1 = enable the RHR interrupt |

[1] IER[7:4] can only be modified if EFR[4] is set, i.e., EFR[4] is a write enable. Re-enabling IER[1] will not cause a new interrupt if the THR is below the threshold.

7.9 Interrupt Identification Register (IIR)

The IIR is a read-only 8-bit register which provides the source of the interrupt in a prioritized manner. [Table 17](#) shows Interrupt Identification Register bit settings.

Table 17. Interrupt Identification Register bits description

| Bit | Symbol | Description |
|-----|----------|---|
| 7:6 | IIR[7:6] | Mirror the contents of FCR[0] |
| 5 | IIR[5] | $\overline{\text{RTSn}}/\overline{\text{CTS}}_{\text{n}}$ LOW-to-HIGH change of state |
| 4 | IIR[4] | 1 = Xoff/Special character has been detected |
| 3:1 | IIR[3:1] | 3-bit encoded interrupt. See Table 18 . |
| 0 | IIR[0] | Interrupt status. logic 0 = an interrupt is pending logic 1 = no interrupt is pending |

The interrupt priority list is shown in [Table 18](#).

Table 18. Interrupt priority list

| Priority level | IIR[5] | IIR[4] | IIR[3] | IIR[2] | IIR[1] | IIR[0] | Source of the interrupt |
|----------------|--------|--------|--------|--------|--------|--------|--|
| 1 | 0 | 0 | 0 | 1 | 1 | 0 | Receiver Line Status error |
| 2 | 0 | 0 | 1 | 1 | 0 | 0 | Receiver time-out interrupt |
| 2 | 0 | 0 | 0 | 1 | 0 | 0 | RHR interrupt |
| 3 | 0 | 0 | 0 | 0 | 1 | 0 | THR interrupt |
| 4 | 0 | 0 | 0 | 0 | 0 | 0 | Modem interrupt |
| 5 | 0 | 1 | 0 | 0 | 0 | 0 | Received Xoff signal/ special character |
| 6 | 1 | 0 | 0 | 0 | 0 | 0 | $\overline{\text{CTS}}_{\text{n}}$, $\overline{\text{RTS}}_{\text{n}}$ change of state from active (LOW) to inactive (HIGH) |

7.10 Enhanced Feature Register (EFR)

This 8-bit register enables or disables the enhanced features of the UART. [Table 19](#) shows the Enhanced Feature Register bit settings.

Table 19. Enhanced Feature Register bits description

| Bit | Symbol | Description |
|-----|--------|--|
| 7 | EFR[7] | $\overline{\text{CTS}}$ flow control enable. logic 0 = $\overline{\text{CTS}}$ flow control is disabled (normal default condition) logic 1 = $\overline{\text{CTS}}$ flow control is enabled. Transmission will stop when a HIGH signal is detected on the CTS_{n} pin. |
| 6 | EFR[6] | $\overline{\text{RTS}}$ flow control enable. logic 0 = $\overline{\text{RTS}}$ flow control is disabled (normal default condition) logic 1 = $\overline{\text{RTS}}$ flow control is enabled. The $\overline{\text{RTS}}_{\text{n}}$ pin goes HIGH when the receiver FIFO halt trigger level TCR[3:0] is reached, and goes LOW when the receiver FIFO resume transmission trigger level TCR[7:4] is reached. |

Table 19. Enhanced Feature Register bits description ...continued

| Bit | Symbol | Description |
|-----|----------|---|
| 5 | EFR[5] | Special character detect. logic 0 = special character detect disabled (normal default condition) logic 1 = special character detect enabled. Received data is compared with Xoff2 data. If a match occurs, the received data is transferred to FIFO and IIR[4] is set to a logic 1 to indicate a special character has been detected. |
| 4 | EFR[4] | Enhanced functions enable bit. logic 0 = disables enhanced functions and writing to IER[7:4], FCR[5:4], MCR[7:5] logic 1 = enables the enhanced function IER[7:4], FCR[5:4], and MCR[7:5] can be modified, i.e., this bit is therefore a write enable. |
| 3:0 | EFR[3:0] | Combinations of software flow control can be selected by programming these bits. See Table 3 "Software flow control options (EFR[0:3])" . |

7.11 Divisor latches (DLL, DLM)

These are two 8-bit registers which store the 16-bit divisor for generation of the baud clock in the baud rate generator. DLM stores the most significant part of the divisor. DLL stores the least significant part of the divisor.

Note that DLL and DLM can only be written to before Sleep mode is enabled, i.e., before IER[4] is set.

7.12 Transmission Control Register (TCR)

This 8-bit register is used to store the receive FIFO threshold levels to stop/start transmission during hardware/software flow control. [Table 20](#) shows Transmission Control Register bit settings.

Table 20. Transmission Control Register bits description

| Bit | Symbol | Description |
|-----|----------|---|
| 7:4 | TCR[7:4] | receive FIFO trigger level to resume transmission (0 to 60). |
| 3:0 | TCR[3:0] | receive FIFO trigger level to halt transmission (0 to 60). |

TCR trigger levels are available from 0 bytes to 60 bytes with a granularity of four.

Remark: TCR can only be written to when EFR[4] = logic 1 and MCR[6] = logic 1. The programmer must program the TCR such that TCR[3:0] > TCR[7:4]. There is no built-in hardware check to make sure this condition is met. Also, the TCR must be programmed with this condition before $\overline{\text{RTS}}$ or software flow control is enabled to avoid spurious operation of the device.

7.13 Trigger Level Register (TLR)

This 8-bit register is pulsed to store the transmit and received FIFO trigger levels used for DMA and interrupt generation. Trigger levels from 4 to 60 can be programmed with a granularity of 4. [Table 21](#) shows trigger level register bit settings.

Table 21. Trigger Level Register bits description

| Bit | Symbol | Description |
|-----|----------|---|
| 7:4 | TLR[7:4] | receive FIFO trigger levels (4 to 60), number of characters available |
| 3:0 | TLR[3:0] | transmit FIFO trigger levels (4 to 60), number of spaces available |

Remark: TLR can only be written to when EFR[4] = logic 1 and MCR[6] = logic 1. If TLR[3:0] or TLR[7:4] are logic 0, the selectable trigger levels via the FIFO Control Register (FCR) are used for the transmit and receive FIFO trigger levels. Trigger levels from 4 bytes to 60 bytes are available with a granularity of four. The TLR should be programmed for $N/4$, where N is the desired trigger level.

When the trigger level setting in TLR is zero, the SC16C752B uses the trigger level setting defined in FCR. If TLR has non-zero trigger level value, the trigger level defined in FCR is discarded. This applies to both transmit FIFO and receive FIFO trigger level setting.

When TLR is used for RX trigger level control, FCR[7:6] should be left at the default state, i.e., '00'.

7.14 FIFO ready register

The FIFO ready register provides real-time status of the transmit and receive FIFOs of both channels.

Table 22. FIFO Ready Register bits description

| Bit | Symbol | Description |
|-----|---------------|---|
| 7:6 | FIFO Rdy[7:6] | unused; always 0 |
| 5 | FIFO Rdy[5] | receive FIFO B status. Related to DMA. |
| 4 | FIFO Rdy[4] | receive FIFO A status. Related to DMA. |
| 3:2 | FIFO Rdy[3:2] | unused; always 0 |
| 1 | FIFO Rdy[1] | transmit FIFO B status. Related to DMA. |
| 0 | FIFO Rdy[0] | transmit FIFO A status. Related to DMA. |

The FIFO Rdy register is a read-only register that can be accessed when any of the two UARTs is selected \overline{CSA} or \overline{CSB} = logic 0, MCR[2] (FIFO Rdy Enable) is a logic 1, and loopback is disabled. The address is 111.

8. Programmer's guide

The base set of registers that is used during high-speed data transfer have a straightforward access method. The extended function registers require special access bits to be decoded along with the address lines. The following guide will help with programming these registers. Note that the descriptions below are for individual register access. Some streamlining through interleaving can be obtained when programming all the registers.

Table 23. Register programming guide

| Command | Actions |
|---|---|
| Set baud rate to VALUE1, VALUE2 | Read LCR (03h), save in temp Set LCR (03h) to 80h Set DLL (00h) to VALUE1 SET DLM (01h) to VALUE2 Set LCR (03h) to temp |

| $I_{CC(sleep)}$ | sleep mode supply current | [8] | - | - | 50 | - | - | 50 | μA |

[1] Meets TTL levels, $V_{IH(min)} = 2\text{ V}$ and $V_{IL(max)} = 0.8\text{ V}$ on non-hysteresis inputs.

[2] Applies for external output buffers.

[3] These parameters apply for D7 to D0.

[4] These parameters apply for \overline{DTRA} , \overline{DTRB} , INTA, INTB, \overline{RTSA} , \overline{RTSB} , \overline{RXRDYA} , \overline{RXRDYB} , \overline{TXRDYA} , \overline{TXRDYB} , TXA, TXB.

- [5] Except XTAL2, $V_{OL} = 1\text{ V}$ typical.
- [6] These junction temperatures reflect simulated conditions. Absolute maximum junction temperature is $150\text{ }^{\circ}\text{C}$. The customer is responsible for verifying junction temperature.
- [7] Measurement condition, normal operation other than Sleep mode:
 $V_{CC} = 3.3\text{ V}$; $T_{amb} = 25\text{ }^{\circ}\text{C}$. Full duplex serial activity on all two serial (UART) channels at the clock frequency specified in the recommended operating conditions with divisor of 1.
- [8] Sleep mode current might be higher if there is activity on the UART data bus during Sleep mode.

11. Dynamic characteristics

Table 26. Dynamic characteristics

$T_{amb} = -40\text{ }^{\circ}\text{C}$ to $+85\text{ }^{\circ}\text{C}$; $V_{CC} = 2.5\text{ V}$, $3.3\text{ V} \pm 10\%$ or $5\text{ V} \pm 10\%$, unless specified otherwise.

| Symbol | Parameter | Conditions | $V_{CC} = 2.5\text{ V}$ | | $V_{CC} = 3.3\text{ V or } 5\text{ V}$ | | Unit |

13. Soldering of SMD packages

This text provides a very brief insight into a complex technology. A more in-depth account of soldering ICs can be found in Application Note *AN10365 "Surface mount reflow soldering description"*.

13.1 Introduction to soldering

Soldering is one of the most common methods through which packages are attached to Printed Circuit Boards (PCBs), to form electrical circuits. The soldered joint provides both the mechanical and the electrical connection. There is no single soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and Surface Mount Devices (SMDs) are mixed on one printed wiring board; however, it is not suitable for fine pitch SMDs. Reflow soldering is ideal for the small pitches and high densities that come with increased miniaturization.

13.2 Wave and reflow soldering

Wave soldering is a joining technology in which the joints are made by solder coming from a standing wave of liquid solder. The wave soldering process is suitable for the following:

- Through-hole components
- Leaded or leadless SMDs, which are glued to the surface of the printed circuit board

Not all SMDs can be wave soldered. Packages with solder balls, and some leadless packages which have solder lands underneath the body, cannot be wave soldered. Also, leaded SMDs with leads having a pitch smaller than ~0.6 mm cannot be wave soldered, due to an increased probability of bridging.

The reflow soldering process involves applying solder paste to a board, followed by component placement and exposure to a temperature profile. Leaded packages, packages with solder balls, and leadless packages are all reflow solderable.

Key characteristics in both wave and reflow soldering are:

- Board specifications, including the board finish, solder masks and vias
- Package footprints, including solder thieves and orientation
- The moisture sensitivity level of the packages
- Package placement
- Inspection and repair
- Lead-free soldering versus SnPb soldering

13.3 Wave soldering

Key characteristics in wave soldering are:

- Process issues, such as application of adhesive and flux, clinching of leads, board transport, the solder wave parameters, and the time during which components are exposed to the wave
- Solder bath specifications, including temperature and impurities

13.4 Reflow soldering

Key characteristics in reflow soldering are:

- Lead-free versus SnPb soldering; note that a lead-free reflow process usually leads to higher minimum peak temperatures (see [Figure 25](#)) than a SnPb process, thus reducing the process window
- Solder paste printing issues including smearing, release, and adjusting the process window for a mix of large and small components on one board
- Reflow temperature profile; this profile includes preheat, reflow (in which the board is heated to the peak temperature) and cooling down. It is imperative that the peak temperature is high enough for the solder to make reliable solder joints (a solder paste characteristic). In addition, the peak temperature must be low enough that the packages and/or boards are not damaged. The peak temperature of the package depends on package thickness and volume and is classified in accordance with [Table 27](#) and [28](#)

Table 27. SnPb eutectic process (from J-STD-020C)

| Package thickness (mm) | Package reflow temperature (°C) | |
|------------------------|---------------------------------|-------|
| | Volume (mm ³) | |
| | < 350 | ≥ 350 |
| < 2.5 | 235 | 220 |
| ≥ 2.5 | 220 | 220 |

Table 28. Lead-free process (from J-STD-020C)

| Package thickness (mm) | Package reflow temperature (°C) | | |
|------------------------|---------------------------------|-------------|--------|
| | Volume (mm ³) | | |
| | < 350 | 350 to 2000 | > 2000 |
| < 1.6 | 260 | 260 | 260 |
| 1.6 to 2.5 | 260 | 250 | 245 |
| > 2.5 | 250 | 245 | 245 |

Moisture sensitivity precautions, as indicated on the packing, must be respected at all times.

Studies have shown that small packages reach higher temperatures during reflow soldering, see [Figure 25](#).

For further information on temperature profiles, refer to Application Note AN10365 “Surface mount reflow soldering description”.

16. Legal information

16.1 Data sheet status

| Document status ^{[1][2]} | Product status ^[3] | Definition |
|-----------------------------------|-------------------------------|---|
| Objective [short] data sheet | Development | This document contains data from the objective specification for product development. |
| Preliminary [short] data sheet | Qualification | This document contains data from the preliminary specification. |
| Product [short] data sheet | Production | This document contains the product specification. |

[1] Please consult the most recently issued document before initiating or completing a design.

[2] The term 'short data sheet' is explained in section "Definitions".

[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL <http://www.nxp.com>.

16.2 Definitions

Draft — The document is a draft version only. The content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information.

Short data sheet — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

Product specification — The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

16.3 Disclaimers

Limited warranty and liability — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the *Terms and conditions of commercial sale* of NXP Semiconductors.

Right to make changes — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Suitability for use — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or

malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors accepts no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

Applications — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

Limiting values — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

Terms and conditions of commercial sale — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at <http://www.nxp.com/profile/terms>, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

No offer to sell or license — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

Export control — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from national authorities.

Non-automotive qualified products — Unless this data sheet expressly states that this specific NXP Semiconductors product is automotive qualified, the product is not suitable for automotive use. It is neither qualified nor tested in accordance with automotive testing or application requirements. NXP Semiconductors accepts no liability for inclusion and/or use of non-automotive qualified products in automotive equipment or applications.

In the event that customer uses the product for design-in and use in automotive applications to automotive specifications and standards, customer (a) shall use the product without NXP Semiconductors' warranty of the product for such automotive applications, use and specifications, and (b) whenever customer uses the product for automotive applications beyond

NXP Semiconductors' specifications such use shall be solely at customer's own risk, and (c) customer fully indemnifies NXP Semiconductors for any liability, damages or failed product claims resulting from customer design and use of the product for automotive applications beyond NXP Semiconductors' standard warranty and NXP Semiconductors' product specifications.
