EVAL BOARD USER'S MANUAL

DESCRIPTION

This document describes the NB4L16M evaluation board and the appropriate lab test setups. It should be used in conjunction with the NB4L16M data sheets which contain full technical details on the device specifications and operation.

The evaluation board is designed to facilitate a quick evaluation of the NB4L16M Differential Receiver / Driver / Translator. The NB4L16M is designed to function as a high speed receiver/driver/translator device with CML output for use in high speed signal amplification and backplane interface applications.

The board is implemented in two layers and provides a high bandwidth 50 Ω controlled impedance environment for higher performance. The first layer or primary trace layer is 5 mils thick Rogers RO6002 material, which is engineered

to have equal electrical length on all signal traces from the NB4L16M device to the sense output. The second layer is 32 mils thick copper ground plane.

What measurements can you expect to make?

With this evaluation board, the following measurements could be performed in differential modes of operation:

- Jitter
- Output Skew
- Gain/Return Loss
- Eye Pattern Generation
- Frequency Performance
- Output Rise and Fall Time
- V_{CMR} (Input High Common Mode Range)

SETUP FOR TIME DOMAIN MEASUREMENTS

Table 1. BASIC EQUIPMENT

Description	Example Equipment (Note 1)	Qty.
Power Supply with 4 outputs	HP6624A	1
Oscilloscope	TDS8000 with 80E01 Sampling Head (Note 2)	1
Differential Signal Generator	HP 8133A, Advantest D3186	1
Matched High Speed Cables with SMA Connectors	Storm, Semflex	4
Power Supply Cables with Clips		8

1. Equipment used to generate example measurements within this document.
2. 50 GHz sampling head used (for effective rise, fall and jitter performance measurement)

Setup

Step 1: Connect Power

1a: Two power levels must be provided to the board for V_{CC} and V_{EE} via the surface mount clips.

Step 2: Connect Inputs

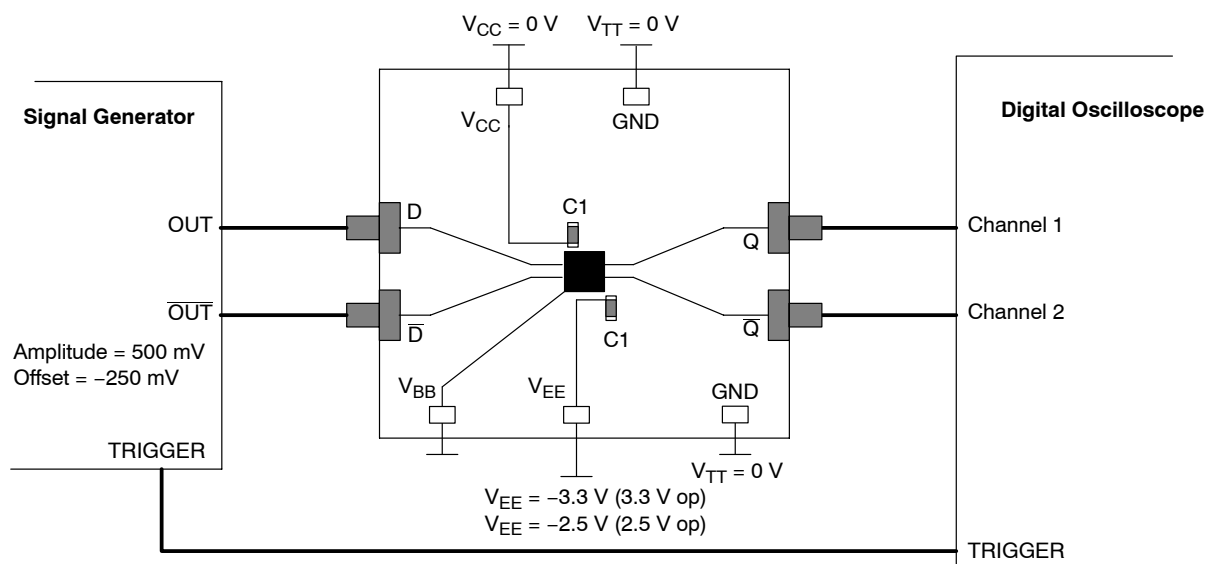

For Differential Mode (3.3 V and 2.5 V operation)

2a: Connect the differential output of the generator to the differential input of the device (D and \bar{D}).

NOTE: Device may oscillate when the input is not driven.

Table 2. NB4L16M Power Supply Connections

3.3 V Setup	2.5 V Setup
$V_{CC} = 0 \text{ V} = \text{GND}$	$V_{CC} = 0 \text{ V} = \text{GND}$
$V_{TT} = V_{CC} = 0 \text{ V} = \text{GND}$	$V_{TT} = V_{CC} = 0 \text{ V} = \text{GND}$
$V_{EE} = -3.3 \text{ V}$	$V_{EE} = -2.5 \text{ V}$

NOTE: All differential cable pairs must be matched.

Figure 2. NB4L16M Board Setup – Time Domain (Differential Mode)

NB4L16MMNEVB

Step 3: Setup Input Signals

3a: Set the signal generator amplitude to 500 mV.

NOTE: The signal generator amplitude can vary from 75 mV to 900 mV to produce a 400 mV DUT output.

3b: Set the signal generator offset to -250 mV.

NOTE: The V_{IHCMR} (Input High Voltage Common Mode Range) allows the signal generator offset to vary as long as V_{IH} is within the V_{IHCMR} range. Refer to the device data sheet for further information.

3c: Set the generator output for a PRBS data signal, or for a square wave clock signal with a 50% duty cycle.

Step 4: Connect Output Signals

4a: Connect the outputs of the device (Q , \overline{Q}) to the oscilloscope. The oscilloscope sampling head must have internal 50 Ω termination to ground.

NOTE: Where a single output is being used, the unconnected output for the pair ***must be*** terminated to V_{TT} through a 50 Ω resistor for best operation. Unused pairs may be left unconnected. Since $V_{TT} = 0$ V, a standard 50 Ω SMA termination is recommended.

SETUP FOR FREQUENCY DOMAIN MEASUREMENTS

Table 3. BASIC EQUIPMENT

Description	Example Equipment (Note 3)	Qty
Power Supply with 4 outputs	HP 6624A	1
Vector Network Analyzer (VNA)	R&S ZVK (10 MHz to 40 GHz)	1
180° Hybrid Coupler	Krytar Model #4010180	1
Bias Tee with 50 Ω Resistor Termination	Picosecond Model #5542-219	1
Matched High Speed Cables with SMA Connectors	Storm, Semflex	3
Power Supply Cables with Clips		8

3. Equipment used to generate example measurements within this document.

Setup

Step 1: Connect Power

1a: Two power levels must be provided to the board for V_{CC} and V_{EE} via the surface mount clips.

Table 4. NB4L16M Power Supply Connections

3.3 V Setup
$V_{CC} = 0$ V = GND
$V_{TT} = V_{CC} = 0$ V = GND
$V_{EE} = -3.3$ V

Setup Test Configurations for Differential Operation

Small Signal Setup

Step 2: Input Setup

2a: Calibrate VNA from 1.0 GHz to 12 GHz.

2b: Set input level to -35 dBm at the output of the 180° Hybrid coupler (input of the DUT).

Step 3: Output Setup

3a: Set display to measure S21 and record data.

Large Signal Setup

Step 2: Input Setup

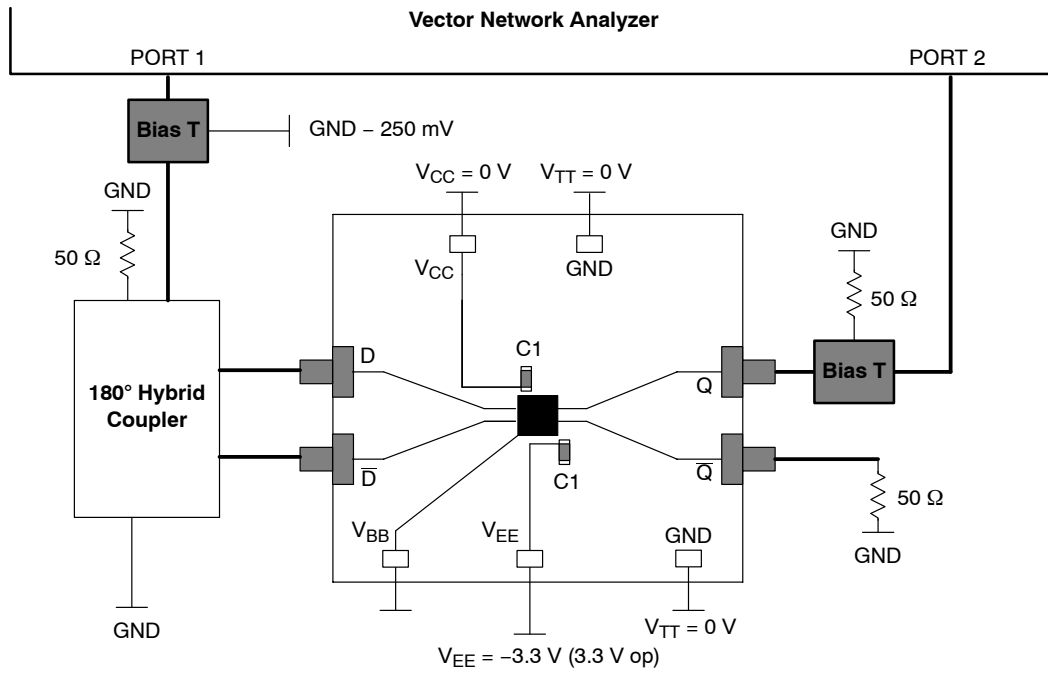

2a: Calibrate VNA from 1.0 GHz to 12 GHz.

2b: Set input levels to -2.0 dBm (500 mV) at the input of DUT.

Step 3: Output Setup

3a: Set display to measure S21 and record data.

MORE INFORMATION ABOUT EVALUATION BOARD

Design Considerations for >10 GHz operation

While the NB4L16M is specified to operate at 12 GHz, this evaluation board is designed to support operating frequencies up to 20 GHz.

The following considerations played a key role to ensure this evaluation board achieves high-end microwave performance:

- Optimal SMA connector launch
- Minimal insertion loss and signal dispersion
- Accurate Transmission line matching (50 ohms)
- Distributed effects while bypassing and noise filtering

NOTE: C1, C2* = Decoupling cap
Tx = 50 Ω Transmission line
