

NB3L208KMNGEVB

NB3L208K Evaluation Board User's Manual

ON Semiconductor®

www.onsemi.com

Introduction

The NB3L208K is a differential 1:8 Clock fanout buffer with High-speed Current Steering Logic (HCSL) outputs. Inputs can directly accept differential LVPECL, LVDS and HCSL signals. Single-ended LVPECL, HCSL, LVCMOS, or LVTTL levels are accepted with a proper external V_{TH} reference supply. These signals will be translated to HCSL and eight identical copies of Clock will be distributed, operating up to 350 MHz.

This manual should be used in conjunction with the device datasheet, which contains full technical details on the device specifications and operation.

EVAL BOARD USER'S MANUAL

This evaluation board manual contains:

- Information on the NB3L208K Evaluation Board
- Block Diagram and Board Schematic
- Assembly Instructions
- Test and Measurement Setup Procedures
- Bill of Materials

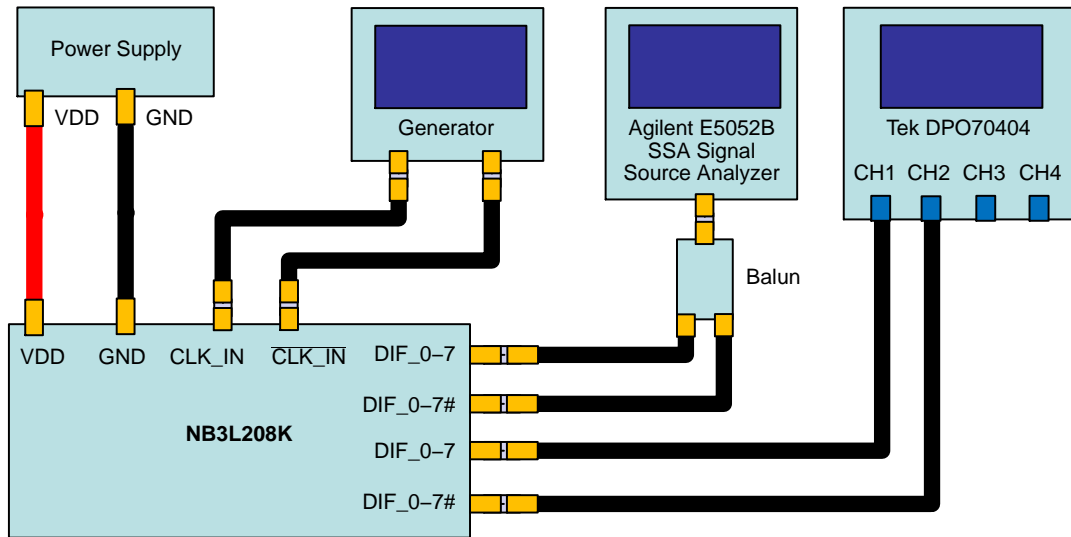

QUICK START LAB SET-UP USER'S GUIDE

Equipment Required

1. DC Power Supply
2. Oscilloscope
3. Phase Noise Analyzer
4. Connectors for DC Power Supply
5. 50-Ω SMA Connectors for I/Os

Block Diagram

Note: Balun Connected to Outputs Only during Phase Noise Testing.

Figure 2. Time and Frequency Domain Block Diagram

Power Supplies

Each VDD, VDD_0 (VX on board), GND_0 (DUTGND on board) and SMAGND power supply has a separate side-launch banana jack located on bottom side of the test board (as shown in Figure 1).

HCSL Outputs

HCSL outputs are typically loaded and terminated with a series resistor (R_{SERIES}) = 33-Ω and 50-Ω to ground. This can be easily accomplished by connecting the HCSL outputs to the 50-Ω internal impedance in the oscilloscope. There are on-board R_{SERIES} = 33-Ω termination resistors installed for each HCSL output.

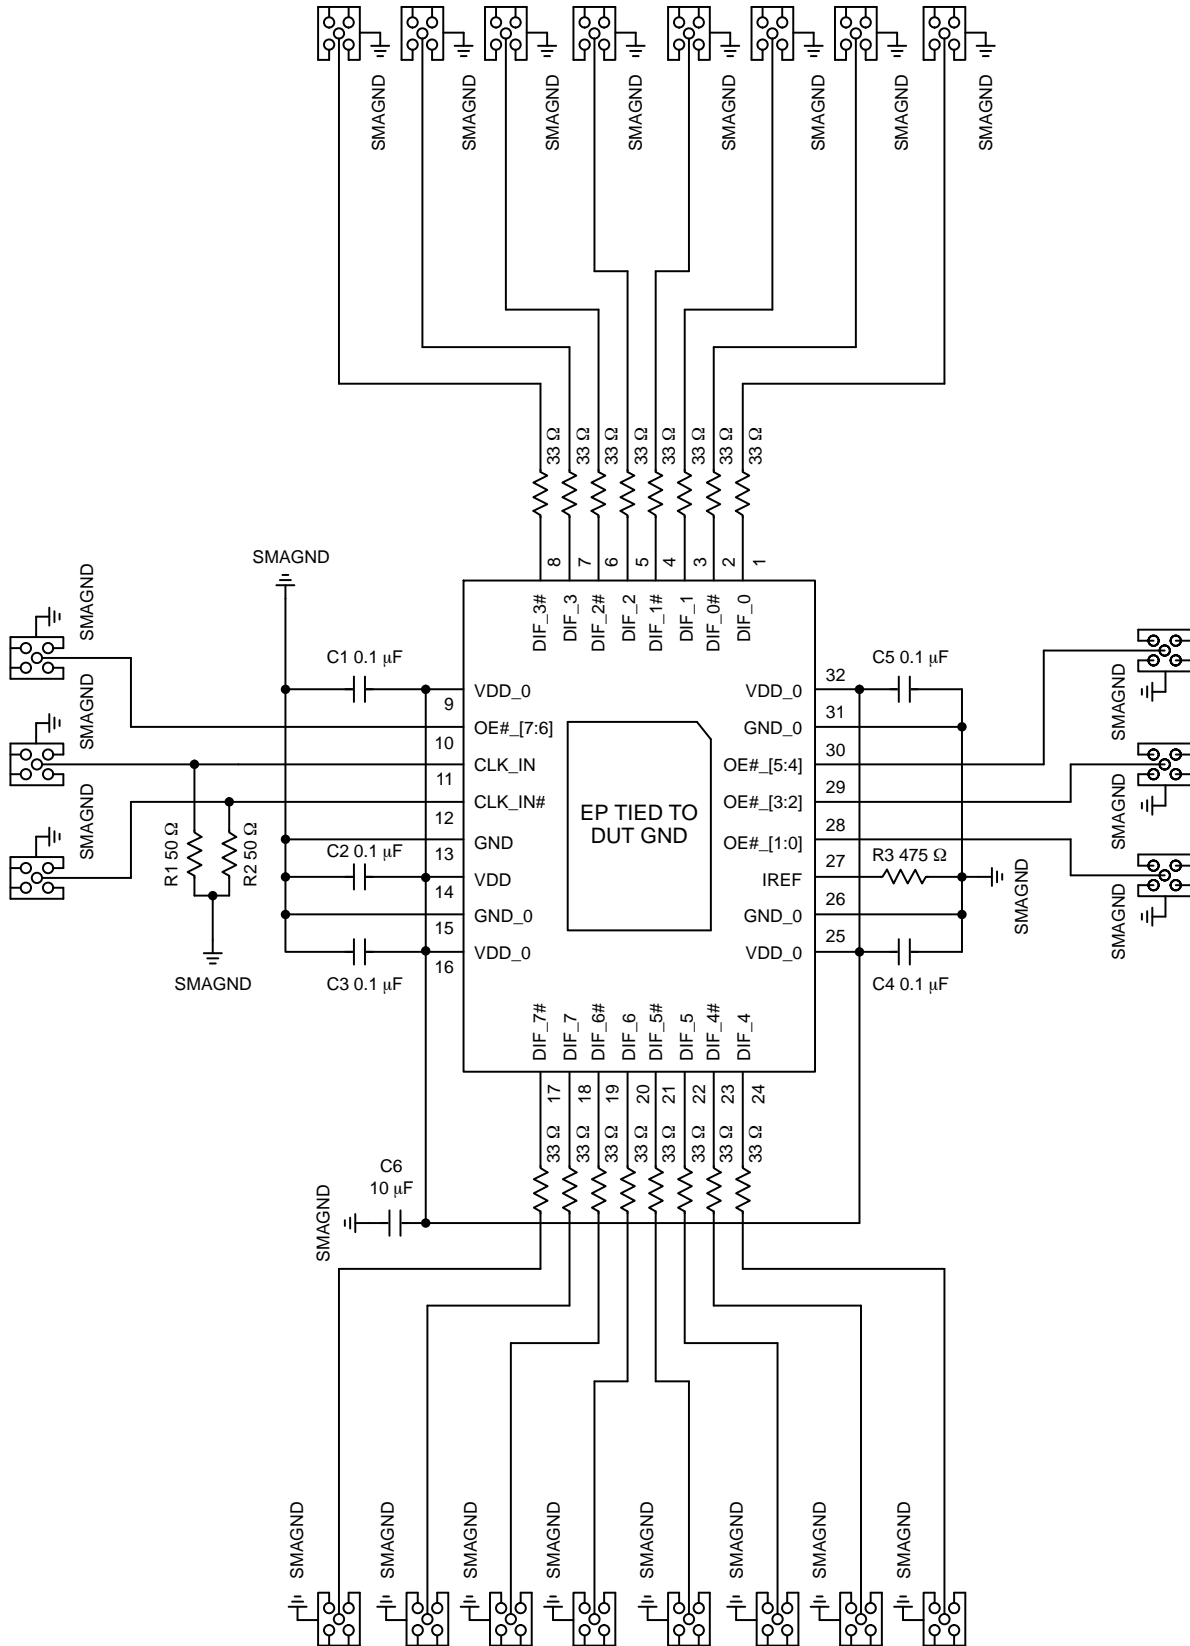

Figure 4. NB3L208KEVB Schematic

Test and Measurement Setup Procedures

1. Connect VDD and VDD_0 (VX on board) of the NB3L208K to DC source with power supply cables (do not turn power on, yet).
2. Connect SMAGND and DUTGND to the appropriate DC source. For differential HCSL inputs, both SMAGND and DUTGND are connected together.
3. Connect the outputs of the generator to the CLK_IN & CLK_IN# inputs with 50- Ω connectors. For phase noise test, low noise generator is required to ensure the best additive RMS Phase jitter of the DUT.
4. Connect the DIF_n/DIF_n# outputs to the appropriate oscilloscope channel. The board does not have 50- Ω output termination, thus use of the probes with 50- Ω termination is required.

Power-Up Sequence

1. Turn on DUT power supply.
2. Setup the generator V_{IH} , V_{IL} levels to set up the inputs to desired inputs levels, i.e differential LVPECL, LVDS, and HCSL signals or Single-ended LVPECL, HCSL, LVCMOS, or LVTTL. For differential HCSL inputs, $V_{IL} = 0$ V and $V_{IH} = 700$ mV.
3. Monitor DIF_n/DIF_n# outputs on oscilloscope.
