## 5270 (H) x 3516 (V) Full Frame CCD Image Sensor

### Description

The KAF-18500 is a dual output, high performance color CCD (charge coupled device) image sensor with 5270 (H) x 3516 (V) photoactive pixels designed for a wide range of color image sensing applications including digital imaging. Each pixel contains anti-blooming protection by means of a lateral overflow drain thereby preventing image corruption during high light level conditions. Each of the 6.8  $\mu\text{m}$  square pixels are selectively covered with red, green or blue pigmented filters for color separation. Microlenses are added for improved sensitivity.

The sensor utilizes the TRUESENSE Transparent Gate Electrode to improve sensitivity compared to the use of a standard front side illuminated polysilicon electrode.

**Table 1. GENERAL SPECIFICATIONS**

Parameter	Typical Value
Architecture	Full Frame CCD with Square Pixels
Total Number of Pixels	5422 (H) x 3610 (V) = 19.6 M
Number of Effective Pixels	5310 (H) x 3556 (V) = 18.8 M
Number of Active Pixels	5270 (H) x 3516 (V) = 18.5 M
Pixel Size	6.8 $\mu\text{m}$ (H) x 6.8 $\mu\text{m}$ (V)
Imager Size	43.1 mm (diagonal), 35 mm Optical format
Chip Size	37.8 mm (H) x 26.4 mm (V)
Aspect Ratio	3:2
Saturation Signal	42 ke <sup>-</sup>
Charge to Voltage Conversion	25 $\mu\text{V}/\text{e}^-$
Quantum Efficiency (RGB)	30%, 45%, 40%
Read Noise (f = 24 MHz)	15.7 e <sup>-</sup>
Dark Signal (T = 60°C)	50 pA/cm <sup>2</sup>
Dark Current Doubling Temperature	5.3°C
Linear Dynamic Range (f = 24 MHz, T = 60°C)	68.1 dB
Charge Transfer Efficiency (HCTE/VCTE)	0.999995 0.999998
Blooming Protection (4 ms exposure time)	5600 X saturation exposure
Maximum Data Rate	24 MHz
Readout Mode	Dual Output Only
Package	PGA
Cover Glass	AR coated (S8612)

NOTE: Unless otherwise noted, all parameters above are specified at T = 20°C to 25°C.

**Figure 1. KAF-18500 CCD Image Sensor**

### Features

- TRUESENSE Transparent Gate Electrode for High Sensitivity
- High Resolution, 35 mm Format
- Broad Dynamic Range
- Low Noise
- Large Image Area

### Applications

- Digital Still Cameras

### ORDERING INFORMATION

See detailed ordering and shipping information on page 2 of this data sheet.

# KAF-18500

## ORDERING INFORMATION

**Table 2. ORDERING INFORMATION**

Part Number	Description	Marking Code
KAF-18500-NXA-JH-AA-08	Special Color, Aperture, Enhanced, ESD, LOD, Microlens, Sealed IR Cover Glass, 0.8 mm glass	KAF-18500-NXA-08
KAF-18500-NXA-JH-AE-08	Special Color, Aperture, Enhanced, ESD, LOD, Microlens, Sealed IR Cover Glass, 0.8 mm glass [Engineering Grade]	

See the ON Semiconductor *Device Nomenclature* document (TND310/D) for a full description of the naming convention used for image sensors. For reference documentation, including information on evaluation kits, please visit our web site at [www.onsemi.com](http://www.onsemi.com).

## HORIZONTAL REGISTER

## Output Structure

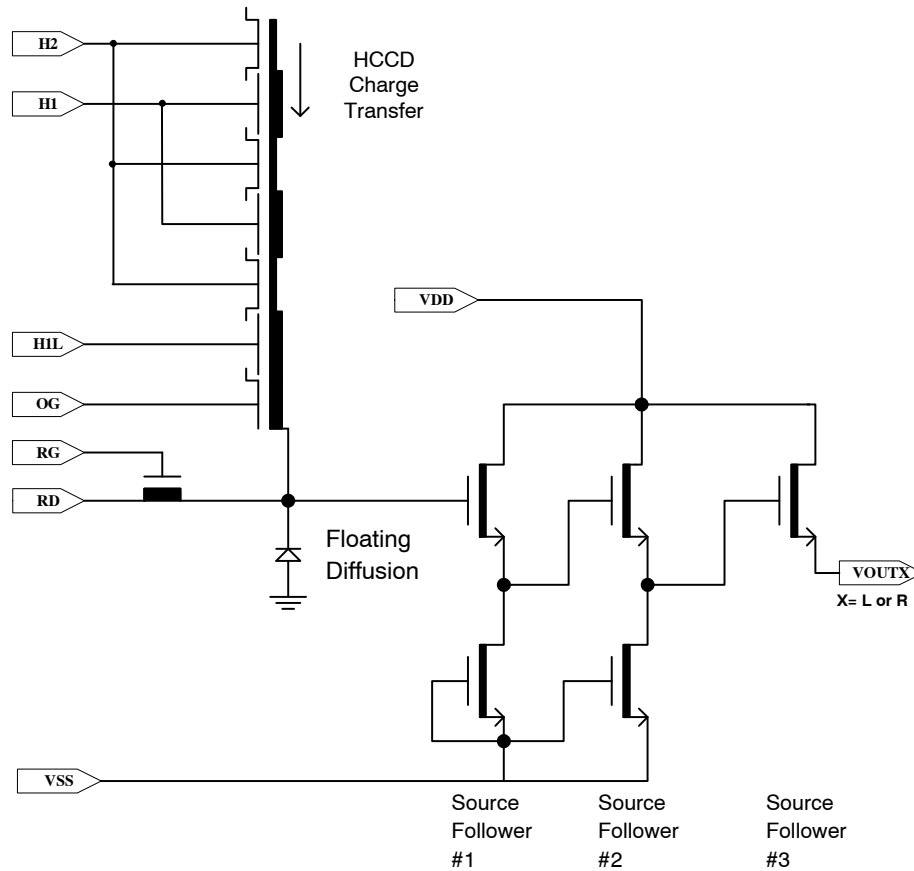

Figure 3. Output Architecture (Left or Right)

The output consists of a floating diffusion capacitance connected to a three-stage source follower. Charge presented to the floating diffusion (FD) is converted into a voltage and is current amplified in order to drive off-chip loads. The resulting voltage change seen at the output is linearly related to the amount of charge placed on the FD. Once the signal has been sampled by the system electronics,

the reset gate (RG) is clocked to remove the signal and FD is reset to the potential applied by reset drain (RD). Increased signal at the floating diffusion reduces the voltage seen at the output pin. To activate the output structures, an off-chip current source must be added to the VOUT pins of the device. See Figure 4.

## Output Load

Note: Component values may be revised based on operating conditions and other design considerations.

**Figure 4. Typical Output Structure Load Diagram**

Reset Feedthru	V <sub>rt</sub>		0.5		V	14	design <sup>18</sup>

- Increasing output load currents to improve bandwidth will decrease the conversion factor (Q/V).
- Worst case deviation (from 10 mV to Vsat min), relative to a linear fit applied between 0 and 85% of Vsat min.
- Difference between the maximum and minimum average signal levels of 148 x 148 blocks within the sensor on a per color basis as a % of average signal level.
- T = 60°C. Average non-illuminated signal with respect to over-clocked vertical register signal.
- T = 60°C. Absolute difference between the maximum and minimum average signal levels of 148 x 148 blocks within the sensor.
- rms deviation of a multi-sampled pixel measured in the dark including amplifier and system noise sources.
- 20log (0.95 \* Vsat/VN). Specified at T = 60°C.
- Gradual variations in hue (red with respect to green pixels and blue with respect to green pixels) in regions of interest (148 x 148 blocks) within the sensor.
- Measured per transfer at Vsat min. Typically, no degradation in CTE is observed up to 24 MHz.
- Xab is the number of times above the Vsat illumination level that the sensor will bloom by spot size doubling. The spot size is 10% of the imager height. Xab is measured at 4 ms.
- Video level offset with respect to ground.
- Last stage only. Assumes 5 pF off-chip load.
- Amount of artificial signal due to H1 coupling.
- Amplitude of feedthrough pulse in VOUT due to RG coupling.
- T = 60°C. Average non-illuminated signal collected due to the read out time.
- Total dark signal = (Vdark,int x t<sub>int</sub>) + (Vdark,read x t<sub>readout</sub>).
- A parameter that is measured on every sensor during production testing.
- A parameter that is quantified during the design verification activity.
- Specified at T = 60°C.

## DEFECT DEFINITIONS

### Operating Conditions

All defect tests performed at:

**Table 9. OPERATING CONDITIONS**

Description	Condition	Notes
Integration time (tint)	Varies per test: Bright Field 250 ms, Dark Field 1 sec, Saturation 250 ms, Low light 33 ms	
Horizontal clock frequency	24 MHz	
Temperature	20 – 25°C	Room temperature

**Table 10. SPECIFICATIONS**

Classification	Points	Clusters, small and large	Clusters, large	Columns	Includes Dead Columns
Standard Grade	≤ 4400	≤ 50	≤ 5	≤ 15	yes

#### *Point Defects*

A pixel that deviates by more than 9 mV above neighboring pixels under non-illuminated conditions.

–or–

A pixel that deviates by more than 7% above or 11% below neighboring pixels under illuminated conditions.

#### *Cluster Defect*

Small clusters: A grouping of adjacent point defects that can number in size from 2 to 10 pixels.

Large clusters: A grouping of more than 10 pixels but not larger than 20 adjacent point defects. A single large cluster is not to exceed 5 adjacent pixels within the same color plane.

#### *Cluster Separation*

Cluster defects are separated by no less than 4 good pixels in any direction.

#### *Column Defect*

A grouping of more than 10 point defects along a single column

–or–

A column that deviates by more than 0.9 mV above or below neighboring columns under non-illuminated conditions.

–or–

A column that deviates by more than 1.5% above or below neighboring columns under illuminated conditions.

Column and cluster defects are separated by at least 4 good columns in the x direction. No multiple column defects (double or more) will be permitted.

#### *Dead Columns*

A column that deviates by more than 50% below neighboring columns under illuminated conditions.

#### *Saturated Columns*

A column that deviates by more than 100 mV above neighboring columns under non-illuminated conditions. No saturated columns are allowed.

## OPERATION

**Table 11. ABSOLUTE MAXIMUM RATINGS**

Description	Symbol	Minimum	Maximum	Units	Notes
Diode Pin Voltages	$V_{\text{diode}}$	-0.5	+17.5	V	1, 2
Gate Pin Voltages	$V_{\text{gate1}}$	-13.5	+13.5	V	1, 3
Gate-Gate Voltages	$V_{1-2}$	-13.5	+13.5	V	4, 5
Output Bias Current	$I_{\text{out}}$		-30	mA	6
LOD Diode Voltage	$V_{\text{LODT}}$	-0.5	+13.0	V	7
Operating Temperature	$T_{\text{OP}}$	0	60	°C	8

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Referenced to pin SUB.
2. Includes pins: RD, VDD, VSS, VOUT.
3. Includes pins: V1, V2, H1, H1L, H2, RG, OG.
4. Voltage difference between overlapping gates. Includes: V1 to V2; H1, H1L to H2; H1L to OG; V1 to H2. These inputs contain an ESD protection circuit. Exceeding the maximum voltages will cause an uncontrolled current to flow in these circuits and may damage the input pin.
5. Voltage difference between non-overlapping gates. Includes: V1 to H1, H1L; V2, OG to H2. These inputs contain an ESD protection circuit. Exceeding the maximum voltages will cause an uncontrolled current to flow in these circuits and may damage the input pin.
6. Avoid shorting output pins to ground or any low impedance source during operation. Amplifier bandwidth increases at higher currents and lower load capacitance at the expense of reduced gain (sensitivity). Operation at the maximum values will reduce Mean Time to Failure (MTTF).
7. V1, H1, V2, H2, H1L, OG, and RD are tied to 0 V.
8. Noise performance will degrade at higher temperatures.
9. Absolute maximum rating is defined as a level or condition that should not be exceeded at any time per the description. If the level or condition is exceeded, the device will be degraded and may be damaged.

### Power-up Sequence

The sequence chosen to perform an initial power-up is not critical for device reliability. A coordinated sequence may minimize noise and the following sequence is recommended:

1. Connect the ground pins (SUB).
2. Supply the appropriate biases and clocks to the remaining pins.

**Table 12. DC BIAS OPERATING CONDITIONS**

Description	Symbol	Minimum	Nominal	Maximum	Units	Maximum DC Current (mA)	Notes
Reset Drain	RD	11.3	11.5	11.7	V	$I_{\text{RD}} = 0.01$	
Output Amplifier Return	VSS	0.5	0.7	1.0	V	$I_{\text{SS}} = 3.0$	
Output Amplifier Supply	VDD	14.5	15.0	15.5	V	$I_{\text{OUT}} + I_{\text{SS}}$	
Substrate	SUB		0		V	0.01	
Output Gate	OG	-2.2	-2.0	-1.8	V	0.01	
Lateral Overflow Drain	LOD	9.8	10.0	10.2	V	0.01	
Video Output Current	$I_{\text{OUT}}$		-5	-10	mA		1

1. An output load sink must be applied to VOUT to activate output amplifier – see Figure 4.

## AC Operating Conditions

Table 13. CLOCK LEVELS

Description	Symbol	Level	Minimum	Nominal	Maximum	Units	Effective Capacitance	Notes
V1 Low Level	V1L	Low	-9.2	-9.0	-8.8	V	245 nF	1, 2
V1 High Level	V1H	High	2.3	2.5	2.7	V	245 nF	1, 2
V2 Low Level	V2L	Low	-9.2	-9.0	-8.8	V	303 nF	1, 2
V2 High Level	V2H	High	2.3	2.5	2.7	V	303 nF	1, 2
H1, H2 (amplitude)	H1amp H2amp	Amplitude	6.5	6.75	7.0	V	See below	
H1 Low Level	H1Low	Low	-4.7	-4.5	-4.3	V	460 pF	1
H2 Low Level	H2Low	Low	-5.2	-5.0	-4.8	V	302 pF	1
H1L Low Level	H1Llow	Low	-6.7	-6.5	-6.3	V	15 pF	1
H1L High Level	H1Lhigh	High	1.3	1.5	1.7	V	15 pF	1
RG Low Level	RGL	Low	0.3	0.5	0.7	V	21 pF	1
RG High Level	RGH	High	7.8	8.0	8.2	V	21 pF	1

1. All pins draw less than 10  $\mu$ A DC current. Capacitance values relative to SUB (substrate).
2. Clock capacitance is the effective capacitance extrapolated from the rise and fall time measured while operating the sensor.

## TIMING

Table 14. REQUIREMENTS AND CHARACTERISTICS

Description	Symbol	Minimum	Nominal	Maximum	Units	Notes
H1, H2 Clock Frequency	$f_H$			24	MHz	1, 2
V1, V2 Clock Frequency	$f_V$			45.5	kHz	1, 2
H1, H2 Rise, Fall Times	$t_{H1r}$ $t_{H1f}$	5		10	%	3, 7
V1, V2 Rise, Fall Times	$t_{V1r}$ $t_{V1f}$	5		10	%	3
V1 – V2 Cross-over	$V_{VCR}$	1			V	
H1 – H2 Cross-over	$V_{HCR}$	-3.0	-1.5	0	V	
H1L Rise – H2 Fall Crossover	$V_{H1LCR}$	-2.0		1.0	V	9
H1, H2 Setup Time	$t_{HS}$	1	5		$\mu$ s	
RG Clock Pulse Width	$t_{RGw}$	5			ns	4
RG Rise, Fall Times	$t_{RGn}$ $t_{RGf}$	5		10	%	3
V1, V2 Clock Pulse Width	$t_{Vw}$	11			$\mu$ s	2, 6
Flush Clock Off Time	$t_{off}$	4			$\mu$ s	2, 6
Pixel Period (1 Count)	$t_e$	42			ns	2
H1L – VOUT Delay	$t_{HV}$		5		ns	
RG – VOUT Delay	$t_{RV}$		5		ns	
Readout Time	$t_{readout}$	505			ms	6, 8
Integration Time	$t_{int}$					5, 6
Line Time	$t_{line}$	140			$\mu$ s	6
Fast Flush Time	$t_{flush}$	88			ms	

1. 50% duty cycle values.
2. CTE will degrade above the nominal frequency.
3. Relative to the pulse width (based on 50% of high/low levels).
4. RG should be clocked continuously.
5. Integration time is user specified.
6. Longer times will degrade noise performance.
7. The maximum specification or 10 nsec whichever is greater based on the frequency of the horizontal clocks.
8.  $t_{readout} = t_{line} * 3610$  lines
9. The charge capacity near the output could be degraded if the voltage at the clock cross over point is outside this range.
