# **5 V ECL 4-Bit D Flip-Flop**

#### Description

The MC10E/100E131 is a quad master-slave D-type flip-flop with differential outputs. Each flip-flop may be clocked separately by holding Common Clock (C<sub>C</sub>) LOW and using the Clock Enable ( $\overline{CE}$ ) inputs for clocking. Common clocking is achieved by holding the  $\overline{CE}$  inputs LOW and using C<sub>C</sub> to clock all four flip-flops. In this case, the  $\overline{CE}$  inputs perform the function of controlling the common clock, to each flip-flop.

Individual asynchronous resets are provided (R). Asynchronous set controls (S) are ganged together in pairs, with the pairing chosen to reflect physical chip symmetry.

Data enters the master when both  $C_C$  and  $\overline{CE}$  are LOW, and transfers to the slave when either  $C_C$  or  $\overline{CE}$  (or both) go HIGH.

The 100 Series contains temperature compensation.
