## MC74LCX574

## Low-Voltage CMOS Octal D-Type Flip-Flop Flow Through Pinout

## With 5 V-Tolerant Inputs and Outputs (3-State, Non-Inverting)

The MC74LCX574 is a high performance, non-inverting octal D-type flip-flop operating from a 2.3 to 3.6 V supply. High impedance TTL compatible inputs significantly reduce current loading to input drivers while TTL compatible outputs offer improved switching noise performance. $\mathrm{A} \mathrm{V}_{\mathrm{I}}$ specification of 5.5 V allows MC74LCX574 inputs to be safely driven from 5.0 V devices.

The MC74LCX574 consists of 8 edge-triggered flip-flops with individual D-type inputs and 3-state true outputs. The buffered clock and buffered Output Enable ( $\overline{\mathrm{OE} \text { ) are common to all flip-flops. The }}$ eight flip-flops will store the state of individual D inputs that meet the setup and hold time requirements on the LOW-to-HIGH Clock (CP) transition. With the $\overline{\mathrm{OE}}$ LOW, the contents of the eight flip-flops are available at the outputs. When the $\overline{\mathrm{OE}}$ is HIGH , the outputs go to the high impedance state. The $\overline{\mathrm{OE}}$ input level does not affect the operation of the flip-flops. The LCX574 flow through design facilitates easy PC board layout.
