2.5V / 3.3V Differential LVPECL 2x2 Clock Switch and Low Skew Fanout Buffer

ON Semiconductor®

<http://onsemi.com>

Description

The NB4L6254 is a differential 2x2 clock switch and drives precisely aligned clock signals through its LVPECL fanout buffers. It employs a fully differential architecture with bipolar technology, offers superior digital signal characteristics, has very low clock output skew and supports clock frequencies from DC up to 3.0 GHz.

The NB4L6254 is designed for the most demanding, skew critical differential clock distribution systems. Typical applications for the NB4L6254 are clock distribution, switching and data loopback systems of high-performance computer, networking and telecommunication systems, as well as on-board clocking of OC-3, OC-12 and OC-48 communication systems. In addition, the NB4L6254 can be configured as a single 1:6 or dual 1:3 LVPECL fanout buffer.

The NB4L6254 can be operated from a single 3.3 V or 2.5 V power supply.

Features

- Maximum Clock Input Frequency, 3 GHz
- Maximum Input Data Rate, 3 Gb/s
- Differential LVPECL Inputs and Outputs
- Low Output Skew: 50 ps Maximum Output-to-Output Skew
- Synchronous Output Enable Eliminating Output Runt Pulse Generation and Metastability
- Operating Range: Single 3.3 V or 2.5 V Supply
 $V_{CC} = 2.375 \text{ V to } 3.465 \text{ V}$
- LVCMOS Compatible Control Inputs
- Packaged in LQFP-32
- Fully Differential Architecture
- -40°C to 85°C Ambient Operating Temperature
- These are Pb-Free Devices*

Table 1. PIN DESCRIPTION

Pin Name	I/O	Description
CLK0, $\overline{\text{CLK0}}$	LVPECL Input	Differential reference clock signal input 0.
CLK1, $\overline{\text{CLK1}}$	LVPECL Input	Differential reference clock signal input 1.
OEAb, $\overline{\text{OEB}}$	LVC MOS Input	Output Enable
SEL0, SEL1	LVC MOS Input	Clock Switch Select
QA[0–2], $\overline{\text{QA}}[0–2]$ QB[0–2], $\overline{\text{QB}}[0–2]$	LVPECL Output	Differential LVPECL Clock Outputs, (banks A and B) Typically terminated with 50 Ω resistor to $V_{CC} - 2.0\text{ V}$.
GND	Power Supply	Negative Supply Voltage
V_{CC}	Power Supply	Positive supply voltage. All V_{CC} pins must be connected to the positive power supply for correct DC and AC operation.
EP		The exposed pad (EP) on the QFN–32 package bottom is thermally connected to the die for improved heat transfer out of the package. The exposed pad must be attached to a heat-sinking conduit. The pad is electrically connected to GND.

APPLICATIONS INFORMATION

Maintaining Lowest Device Skew

The NB4L6254 guarantees low output-to-output bank skew at 50 ps and a part-to-part skew of 250 ps. To ensure low skew clock signals in the application, both outputs of any differential output pair need to be terminated identically, even if only one output is used. When fewer than all nine output pairs are used, identical termination of all output pairs within the output bank is recommended. If an entire output bank is not used, it is recommended to leave all of these outputs open and unterminated. This will reduce the device power consumption while maintaining minimum output skew.

Power Supply Bypassing

The NB4L6254 is a mixed analog/digital product. The differential architecture of the NB4L6254 supports low noise signal operation at high frequencies. In order to maintain its superior signal quality all V_{CC} pins should be bypassed by high-frequency ceramic capacitors connected to GND. If the spectral frequencies of the internally generated switching noise on the supply pins cross the series resonant port of an individual bypass capacitor, its overall impedance begins to look inductive and thus increases with increasing frequency. The parallel capacitor combination shown ensures that a low impedance path to ground exists for frequencies well above the noise bandwidth.
