3.3 V USB 3.1 Dual Channel Re-driver

Description

The NB7NPQ702M is a 3.3 V dual channel re-driver for USB 3.1 Gen 1 and USB 3.1 Gen 2 applications that supports both 5 Gbps and 10 Gbps data rates. Signal integrity degrades from PCB traces, transmission cables, and inter-symbol interference (ISI). The NB7NPQ702M compensates for these losses by engaging varying levels of equalization at the input receiver. The output transmitter circuitry provides user selectable de-emphasis settings to create the best eye openings for the outgoing data signals.

The NB7NPQ702M features an intelligent LFPS circuit. This senses the low frequency signals and automatically disables driver de-emphasis to meet full USB 3.1 Gen 1 and USB 3.1 Gen 2 compliances.

After power up, the NB7NPQ702M periodically checks both of the TX output pairs for a receiver connection. When the receiver is detected the RX termination becomes enabled and the NB7NPQ702M is set to perform the re-driver function.

The NB7NPQ702M comes in a small 3 x 3 mm UQFN16 package and is specified to operate across the entire industrial temperature range, -40°C to 85°C.

Features

- 3.3 V \pm 5% Power Supply
- Device Supports USB 3.1 Gen 1 and USB 3.1 Gen 2 Data Rates
- Automatic LFPS De-Emphasis Control
- Automatic Receiver Termination Detection
- Integrated Input and Output Termination
- Selectable Equalization and De-Emphasis
- Hot-Plug Capable
- ESD Protection \pm 4 kV HBM
- Operating Temperature Range: -40°C to 85°C
- Small 3 x 3 x 0.5 mm UQFN16 Package
- This is a Pb-Free Device

Typical Applications

- USB3.1 Type-C Signal Routing
- Mobile Phone and Tablet
- Computer and Laptop
- Docking Station and Dongle
- Active Cable, Back Planes
- Gaming Console, Smart T.V.

APPLICATION GUIDELINES

LFPS Compliance Testing

As part of USB 3.1 compliance test, the host or peripheral must transmit a LFPS signal that adheres to the spec parameters. When using a real-time oscilloscope to capture this data, *the scope's trigger must be below 0 V when making single-ended measurements*. Although the differential signal is identical to that which is expected by the USB 3.1 system, the AC common mode voltage for LFPS may fall below 0 V during short bursts of switching signal, which is still within the spec's limit.

LFPS Functionality

USB 3.1 links use Low Frequency Periodic Signaling (LFPS) to implement functions like exiting low-power modes, performing warm resets and providing link training

between host and peripheral devices. LFPS signaling consists of bursts of frequencies ranging between 10 to 50 MHz and can have specific burst lengths or repeat rates.

Ping.LFPS for TX Compliance

During the transmitter compliance, the system under test must transmit certain compliance patterns as defined by the USB-IF. In order to toggle through these patterns for various tests, the receiver must receive a ping. LFPS signal from either the test suite or a separate pattern generator. The standard signal comprises of a single burst period of 100ns at 20 MHz. In order to pass this signal through NB7NPQ702M, *the duration of the burst must be extended to at least 200 ns*.
