

2.5V PROGRAMMABLE SKEW PLL CLOCK DRIVER TERACLOCK™

IDT5T9010

Product Discontinuance Notice – Last Time Buy Expires on (2/24/2014)

FEATURES:

- 2.5 V_{DD}
- 5 pairs of programmable skew outputs
- Low skew: 50ps same pair, 100ps all outputs
- Selectable positive or negative edge synchronization
- Tolerant of spread spectrum input clock
- Synchronous output enable
- Selectable reference input
- Input frequency: 4.17MHz to 250MHz
- Output frequency: 12.5MHz to 250MHz
- 1.8V / 2.5V LVTTTL: up to 250MHz
- HSTL / eHSTL: up to 250MHz
- Hot insertable and over-voltage tolerant inputs
- 3-level inputs for skew control
- 3-level inputs for selectable interface
- 3-level inputs for divide selection multiply/divide ratios of (1-6, 8, 10, 12) / (2, 4)
- Selectable HSTL, eHSTL, 1.8V/2.5V LVTTTL, or LVEPECL input interface
- Selectable differential or single-ended inputs and ten single-ended outputs
- PLL bypass for DC testing
- External differential feedback, internal loop filter
- Low Jitter: <75ps cycle-to-cycle
- Power-down mode
- Lock indicator
- Available in BGA package

DESCRIPTION:

The IDT5T9010 is a 2.5V PLL clock driver intended for high performance computing and data-communications applications. A key feature of the programmable skew is the ability of outputs to lead or lag the REF input signal. The IDT5T9010 has ten programmable skew outputs in five banks of two, plus a dedicated differential feedback. Skew is controlled by 3-level input signals that may be hard-wired to appropriate high-mid-low levels. The redundant input capability allows for a smooth change over to a secondary clock source when the primary clock source is absent.

The feedback bank allows divide-by-functionality from 1 to 12 through the use of the DS[1:0] inputs. This provides the user with frequency multiplication 1 to 12 without using divided outputs for feedback. Each output bank also allows for a divide-by-functionality of 2 or 4.

The IDT5T9010 features a user-selectable, single-ended or differential input to ten single-ended outputs. The clock driver also acts as a translator from a differential HSTL, eHSTL, 1.8V/2.5V LVTTTL, LVEPECL, or single-ended 1.8V/2.5V LVTTTL input to HSTL, eHSTL, or 1.8V/2.5V LVTTTL outputs. Selectable interface is controlled by 3-level input signals that may be hard-wired to appropriate high-mid-low levels. The outputs can be synchronously enabled/disabled.

Furthermore, when PE is held high, all the outputs are synchronized with the positive edge of the REF clock input. When PE is held low, all the outputs are synchronized with the negative edge of REF.

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

Symbol	Description	Max	Unit
V _{DDQ} , V _{DD}	Power Supply Voltage ⁽²⁾	-0.5 to +3.6	V
V _I	Input Voltage	-0.5 to +3.6	V
V _O	Output Voltage	-0.5 to V _{DDQ} +0.5	V
V _{REF}	Reference Voltage ⁽³⁾	-0.5 to +3.6	V
T _J	Junction Temperature	150	°C
T _{STG}	Storage Temperature	-65 to +165	°C

NOTES:

- Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- V_{DDQ} and V_{DD} internally operate independently. No power sequencing requirements need to be met.
- Not to exceed 3.6V.

CAPACITANCE_(T_A = +25°C, f = 1MHz, V_{IN} = 0V)

Parameter	Description	Min.	Typ.	Max.	Unit
C _{IN}	Input Capacitance	2.5	3	3.5	pF
C _{OUT}	Output Capacitance	—	6.3	7	pF

NOTE:

- Capacitance applies to all inputs except RxS, TxS, nF[2:0], FBF[2:0], and DS[1:0].

NOTE:

- All power supplies should operate in tandem. If V_{DD} or V_{DDQ} is at maximum, then V_{DDQ} or V_{DD} (respectively) should be at maximum, and vice-versa.

PIN DESCRIPTION

Symbol	I/O	Type	Description
REF[1:0]	I	Adjustable ⁽¹⁾	Clock input. REF[1:0] is the "true" side of the differential clock input. If operating in single-ended mode, REF[1:0] is the clock input.
$\overline{\text{REF}}[1:0]$ / V _{REF} [1:0]	I	Adjustable ⁽¹⁾	Complementary clock input. $\overline{\text{REF}}[1:0]$ /V _{REF} [1:0] is the "complementary" side of REF[1:0] if the input is in differential mode. If operating in single-ended mode, $\overline{\text{REF}}[1:0]$ /V _{REF} [1:0] is left floating. For single-ended operation in differential mode, $\overline{\text{REF}}[1:0]$ /V _{REF} [1:0] should be set to the desired toggle voltage for REF[1:0]: 2.5V LVTTTL V _{REF} = 1250mV (SSTL2 compatible) 1.8V LVTTTL, eHSTL V _{REF} = 900mV HSTL V _{REF} = 750mV LVEPECL V _{REF} = 1082mV
FB	I	Adjustable ⁽¹⁾	Clock input. FB is the "true" side of the differential feedback clock input. If operating in single-ended mode, FB is the feedback clock input.
$\overline{\text{FB}}/V_{\text{REF}2}$	I	Adjustable ⁽¹⁾	Complementary feedback clock input. $\overline{\text{FB}}/V_{\text{REF}2}$ is the "complementary" side of FB if the input is in differential mode. If operating in single-ended mode, $\overline{\text{FB}}/V_{\text{REF}2}$ is left floating. For single-ended operation in differential mode, $\overline{\text{FB}}/V_{\text{REF}2}$ should be set to the desired toggle voltage for FB: 2.5V LVTTTL V _{REF} = 1250mV (SSTL2 compatible) 1.8V LVTTTL, eHSTL V _{REF} = 900mV HSTL V _{REF} = 750mV LVEPECL V _{REF} = 1082mV

NOTE:

- Inputs are capable of translating the following interface standards. User can select between:
 Single-ended 2.5V LVTTTL levels
 Single-ended 1.8V LVTTTL levels
 or
 Differential 2.5V/1.8V LVTTTL levels
 Differential HSTL and eHSTL levels
 Differential LVEPECL levels

PIN DESCRIPTION, CONTINUED

Symbol	I/O	Type	Description
REF_SEL	I	LVTTL ⁽¹⁾	Reference clock select. When LOW, selects REF ₀ and $\overline{\text{REF}}_0/V_{\text{REF}0}$. When HIGH, selects REF ₁ and $\overline{\text{REF}}_1/V_{\text{REF}1}$.
$\overline{\text{nsOE}}$	I	LVTTL ⁽¹⁾	Synchronous output enable. When $\overline{\text{nsOE}}$ is HIGH, nQ _[1:0] are synchronously stopped. OMODE selects whether the outputs are gated LOW/HIGH or tri-stated. When OMODE is HIGH, PE determines the level at which the outputs stop. When PE is LOW/HIGH, the nQ _[1:0] is stopped in a HIGH/LOW state. When OMODE is LOW, the outputs are tri-stated. Set $\overline{\text{nsOE}}$ LOW for normal operation.
QFB	O	Adjustable ⁽²⁾	Feedback clock output
$\overline{\text{QFB}}$	O	Adjustable ⁽²⁾	Complementary feedback clock output
nQ _[1:0]	O	Adjustable ⁽²⁾	Five banks of two outputs
RxS	I	3-Level ⁽³⁾	Selects single-ended 2.5V LVTTL (HIGH), 1.8V LVTTL (MID) REF clock input or differential (LOW) REF clock input
TxS	I	3-Level ⁽³⁾	Sets the drive strength of the output drivers and feedback inputs to be 2.5V LVTTL (HIGH), 1.8V LVTTL (MID) or HSTL/eHSTL (LOW) compatible. Used in conjunction with V _{DD0} to set the interface levels.
PE	I	LVTTL ⁽¹⁾	Selectable positive or negative edge control. When LOW/HIGH the outputs are synchronized with the negative/positive edge of the reference clock (has internal pull-up).
nF _[2:0]	I	3-Level ⁽³⁾	3-level inputs for selecting 1 to 18 skew taps or frequency functions (See Control Summary table)
FBF _[2:0]	I	3-Level ⁽³⁾	3-level inputs for selecting 1 to 18 skew taps or frequency functions (See Control Summary table)
FS	I	LVTTL ⁽¹⁾	Selects appropriate oscillator circuit based on anticipated frequency range (See Programmable Skew Range)
DS _[1:0]	I	3-Level ⁽³⁾	3-level inputs for feedback input divider selection (See Divide Selection table)
$\overline{\text{PLL_EN}}$	I	LVTTL ⁽¹⁾	PLL enable/disable control. Set LOW for normal operation. When $\overline{\text{PLL_EN}}$ is HIGH, the PLL is disabled and REF _[1:0] goes to all outputs.
$\overline{\text{PD}}$	I	LVTTL ⁽¹⁾	Power down control. When $\overline{\text{PD}}$ is LOW, the inputs are disabled and internal switching is stopped. OMODE selects whether the outputs are gated LOW/HIGH or tri-stated. When OMODE is HIGH, PE determines the level at which the outputs stop. When PE is LOW/HIGH, the nQ _[1:0] and QFB are stopped in a HIGH/LOW state, while the $\overline{\text{QFB}}$ is stopped in a LOW/HIGH state. When OMODE is LOW, the outputs are tri-stated. Set $\overline{\text{PD}}$ HIGH for normal operation.
LOCK	O	LVTTL	PLL lock indication signal. HIGH indicates lock. LOW indicates that the PLL is not locked and outputs may not be synchronized to the inputs. (For more information on application specific use of the LOCK pin, please see AN237.)
OMODE	I	LVTTL ⁽¹⁾	Output disable control. Determines the outputs' disable state. Used in conjunction with $\overline{\text{nsOE}}$ and $\overline{\text{PD}}$. (See Output Enable/Disable and Powerdown tables.)
V _{DD0}		PWR	Power supply for output buffers. When using 2.5V LVTTL, V _{DD0} should be connected to V _{DD} .
V _{DD}		PWR	Power supply for phase locked loop, lock output, inputs, and other internal circuitry
GND		PWR	Ground

NOTES:

1. Pins listed as LVTTL inputs will accept 2.5V signals under all conditions. If the output is operating at 1.8V or 1.5V, the LVTTL inputs will accept the 1.8V LVTTL signals as well.
2. Outputs are user selectable to drive 2.5V, 1.8V LVTTL, eHSTL, or HSTL interface levels when used with the appropriate V_{DD0} voltage.
3. 3-level inputs are static inputs and must be tied to V_{DD} or GND or left floating. These inputs are not hot-insertable or over voltage tolerant.

OUTPUT ENABLE/DISABLE

$\overline{\text{nsOE}}$	OMODE	Output
L	X	Normal Operation
H	L	Tri-State
H	H	Gated ⁽¹⁾

NOTE:

1. PE determines the level at which the outputs stop. When PE is LOW/HIGH, the nQ_[1:0] is stopped in a HIGH/LOW state.

POWERDOWN

$\overline{\text{PD}}$	OMODE	Output
H	X	Normal Operation
L	L	Tri-State
L	H	Gated ⁽¹⁾

NOTE:

1. PE determines the level at which the outputs stop. When PE is LOW/HIGH, the nQ_[1:0] and QFB are stopped in a HIGH/LOW state, while the $\overline{\text{QFB}}$ is stopped in a LOW/HIGH state.

PROGRAMMABLE SKEW

Output skew with respect to the REF[1:0] and $\overline{\text{REF}}[1:0]/\text{VREF}[1:0]$ input is adjustable to compensate for PCB trace delays, backplane propagation delays or to accommodate requirements for special timing relationships between clocked components. Skew is selectable as a multiple of a time unit (tu) which ranges from 250ps to 1.25ns (see Programmable Skew Range and Resolution Table). There are 18 skew/divide configurations available for each output pair. These configurations are chosen

by the nF[2:0]/FBF[2:0] control pins. In order to minimize the number of control pins, 3-level inputs (HIGH-MID-LOW) are used, they are intended for but not restricted to hard-wiring. Undriven 3-level inputs default to the MID level. The Control Summary Table shows how to select specific skew taps by using the nF[2:0]/FBF[2:0] control pins.

EXTERNAL DIFFERENTIAL FEEDBACK

By providing a dedicated external differential feedback, the IDT5T9010 gives users flexibility with regard to skew adjustment. The FB and $\overline{\text{FB}}$ /VREF2 signals are compared with the input REF[1:0] and $\overline{\text{REF}}[1:0]/\text{VREF}[1:0]$ signals at the phase detector in order to drive the VCO. Phase differences cause the VCO of the PLL to adjust upwards or downwards accordingly.

An internal loop filter moderates the response of the VCO to the phase detector. The loop filter transfer function has been chosen to provide minimal jitter (or frequency variation) while still providing accurate responses to input frequency changes.

Example 6, $F_{\text{NOM}} = 250\text{MHz}$	—	tu = 0.25ns	

NOTES:

- The device may be operated outside recommended frequency ranges without damage, but functional operation is not guaranteed.
- The level to be set on FS is determined by the nominal operating frequency of the VCO and Time Unit Generator. The VCO frequency always appears at nQ[1:0] outputs when they are operated in their undivided modes. The frequency appearing at the REF[1:0] and $\overline{\text{REF}}[1:0]/\text{VREF}[1:0]$ and FB and $\overline{\text{FB}}/\text{VREF}2$ inputs will be F_{NOM} when the QFB and $\overline{\text{QFB}}$ are undivided and DS[1:0] = MM. The frequency of the REF[1:0] and $\overline{\text{REF}}[1:0]/\text{VREF}[1:0]$ and FB and $\overline{\text{FB}}/\text{VREF}2$ inputs will be $F_{\text{NOM}}/2$ or $F_{\text{NOM}}/4$ when the part is configured for frequency multiplication by using a divided QFB and $\overline{\text{QFB}}$ and setting DS[1:0] = MM. Using the DS[1:0] inputs allows a different method for frequency multiplication (see Divide Selection Table).
- Skew adjustment range assumes that a zero skew output is used for feedback. If a skewed QFB and $\overline{\text{QFB}}$ output is used for feedback, then adjustment range will be greater. For example if a 4tu skewed output is used for feedback, all other outputs will be skewed -4tu in addition to whatever skew value is programmed for those outputs. 'Max adjustment' range applies to all output pairs where $\pm 7\text{tu}$ skew adjustment is possible and at the lowest F_{NOM} value.

NOTE:
1. The INPUT/OUTPUT SELECTION Table describes the total possible combinations of input and output interfaces. Single-Ended (SE) inputs in a single-ended mode require the REF_[1:0]/VREF_[1:0] and FB/VREF₂ pins to be left floating. Differential Single-Ended (DSE) is for single-ended operation in differential mode, requiring VREF_[1:0] and VREF₂. Differential (DIF) inputs are used only in differential mode.

NOTE:
1. These inputs are normally wired to V_{DD}, GND, or left floating. Internal termination resistors bias unconnected inputs to V_{DD}/2. If these inputs are switched dynamically after powerup, the function and timing of the outputs may be glitched, and the PLL may require additional t_{LOCK} time before all datasheet limits are achieved.

NOTES:

- See RECOMMENDED OPERATING RANGE table.
- V_{DIF} specifies the minimum input differential voltage (V_{TR} - V_{CP}) required for switching where V_{TR} is the "true" input level and V_{CP} is the "complement" input level. Differential mode only. The DC differential voltage must be maintained to guarantee retaining the existing HIGH or LOW input. The AC differential voltage must be achieved to guarantee switching to a new state.
- V_{CM} specifies the maximum allowable range of (V_{TR} + V_{CP}) / 2. Differential mode only.
- For single-ended operation, in differential mode, $\overline{\text{REF}}_{[1:0]}/\text{VREF}_{[1:0]}$ is tied to the DC voltage V_{REF[1:0]}.
- Voltage required to maintain a logic HIGH, single-ended operation in differential mode.
- Voltage required to maintain a logic LOW, single-ended operation in differential mode.
- Typical values are at V_{DD} = 2.5V, V_{DDQ} = 1.5V, +25°C ambient.
- The reference clock input is capable of HSTL, eHSTL, LVEPECL, 1.8V or 2.5V LVTTTL operation independent of the device output. (See Input/Output Selection table.)

NOTES:

1. See RECOMMENDED OPERATING RANGE table.
2. V_{DIF} specifies the minimum input differential voltage (V_{TR} - V_{CP}) required for switching where V_{TR} is the "true" input level and V_{CP} is the "complement" input level. Differential mode only. The DC differential voltage must be maintained to guarantee retaining the existing HIGH or LOW input. The AC differential voltage must be achieved to guarantee switching to a new state.
3. V_{CM} specifies the maximum allowable range of (V_{TR} + V_{CP}) /2. Differential mode only.
4. For single-ended operation, in a differential mode, $\overline{\text{REF}}_{[1:0]}/\text{VREF}_{[1:0]}$ is tied to the DC voltage V_{REF}[1:0].
5. Voltage required to maintain a logic HIGH, single-ended operation in differential mode.
6. Voltage required to maintain a logic LOW, single-ended operation in differential mode.
7. Typical values are at V_{DD} = 2.5V, V_{DDQ} = 1.8V, +25°C ambient.
8. The reference clock input is capable of HSTL, eHSTL, LVEPECL, 1.8V or 2.5V LVTTTL operation independent of the device output. (See Input/Output Selection table.)

		I _{OL} = 100μA	—		0.1	V

NOTES:

- See RECOMMENDED OPERATING RANGE table.
- For 1.8V LVTTL single-ended operation, the RxS pin is MID and $\overline{\text{REF}}_{[1:0]}/\text{VREF}_{[1:0]}$ is left floating. If TxS is MID, $\overline{\text{FB}}/\text{VREF2}$ should be left floating.
- V_{DIF} specifies the minimum input differential voltage (V_{TR} - V_{CP}) required for switching where V_{TR} is the "true" input level and V_{CP} is the "complement" input level. Differential mode only. The DC differential voltage must be maintained to guarantee retaining the existing HIGH or LOW input. The AC differential voltage must be achieved to guarantee switching to a new state.
- V_{CM} specifies the maximum allowable range of (V_{TR} + V_{CP}) / 2. Differential mode only.
- For single-ended operation in differential mode, $\overline{\text{REF}}_{[1:0]}/\text{VREF}_{[1:0]}$ is tied to the DC voltage V_{REF[1:0]}. The input is guaranteed to toggle within ±200mV of V_{REF[1:0]} when V_{REF[1:0]} is constrained within +600mV and V_{DDI}-600mV, where V_{DDI} is the nominal 1.8V power supply of the device driving the REF_[1:0] input. To guarantee switching in voltage range specified in the JEDEC 1.8V LVTTL interface specification, V_{REF[1:0]} must be maintained at 900mV with appropriate tolerances.
- Voltage required to maintain a logic HIGH, single-ended operation in differential mode.
- Voltage required to maintain a logic LOW, single-ended operation in differential mode.
- Typical values are at V_{DD} = 2.5V, V_{DDQ} = 1.8V, +25°C ambient.
- The reference clock input is capable of HSTL, eHSTL, LVEPECL, 1.8V or 2.5V LVTTL operation independent of the device output. (See Input/Output Selection table.)
- This value is the worst case minimum V_{IH} over the specification range of the 1.8V power supply. The 1.8V LVTTL specification is V_{IH} = 0.65 * V_{DD} where V_{DD} is 1.8V ± 0.15V. However, the LVTTL translator is supplied by a 2.5V nominal supply on this part. To ensure compliance with the specification, the translator was designed to accept the calculated worst case value (V_{IH} = 0.65 * [1.8 - 0.15V]) rather than reference against a nominal 1.8V supply.
- This value is the worst case maximum V_{IL} over the specification range of the 1.8V power supply. The 1.8V LVTTL specification is V_{IL} = 0.35 * V_{DD} where V_{DD} is 1.8V ± 0.15V. However, the LVTTL translator is supplied by a 2.5V nominal supply on this part. To ensure compliance with the specification, the translator was designed to accept the calculated worst case value (V_{IL} = 0.35 * [1.8 + 0.15V]) rather than reference against a nominal 1.8V supply.

NOTES:

- Skew is the time between the earliest and latest output transition among all outputs for which the same t_u delay has been selected, and when all outputs are loaded with the specified load.
- t_{sk(B)} is the skew between a pair of outputs (nQ0 and nQ1) when all outputs are selected as the same class.
- The measurement is made at V_{DD0}/2.
- There are three classes of outputs: nominal (multiple of t_u delay), inverted, and divided (divide-by-2 or divide-by-4 mode).
- t_{sk(PR)} is the output to corresponding output skew between any two devices operating under the same conditions (V_{DD} and V_{DD0}, ambient temperature, air flow, etc.).
- t(φ) is measured with REF and FB the same type of input, the same rise and fall times. For TxS/RxS = MID or HIGH, the measurement is taken from V_{TH1} on REF to V_{TH1} on FB. For TxS/RxS = LOW, the measurement is taken from the crosspoint of REF/REF to the crosspoint of FB/FB. All outputs are set to 0t_u, FB input divider set to divide-by-one, and FS = HIGH.
- t_{ODCV} is measured with all outputs selected for 0t_u.
- Output rise and fall times are measured between 20% to 80% of the actual output voltage swing.
- t_L, t_{L(ω)}, t_{L(REFSEL1)}, t_{L(REFSEL2)}, and t_{L(PD)} are the times that are required before the synchronization is achieved. These specifications are valid only after V_{DD}/V_{DD0} is stable and within the normal operating limits. These parameters are measured from the application of a new signal at REF or FB, or after PD is (re)asserted until t(φ) is within specified limits.
- The jitter parameters are measured with all outputs selected for 0t_u, FB input divider is set to divide-by-one, and FS = HIGH.
- Both REF inputs must be the same frequency, but up to ±180° out of phase.
- For HSTL/eHSTL outputs only.

V _{IH}	AC Input HIGH ⁽⁴⁾	1275	—	—	mV
V _{IL}	AC Input LOW ⁽⁴⁾	—	—	875	mV

NOTES:

- For differential input mode, RxS is tied to GND.
- Both differential input signals should not be driven to the same level simultaneously. The input will not change state until the inputs have crossed and the voltage range defined by V_{DIF} has been met or exceeded.
- Differential mode only. V_{DIF} specifies the minimum input voltage (V_{TR} - V_{CP}) required for switching where V_{TR} is the "true" input level and V_{CP} is the "complement" input level. The AC differential voltage must be achieved to guarantee switching to a new state.
- For single-ended operation, $\overline{REF}_{[1:0]}/V_{REF[1:0]}$ is tied to the DC voltage V_{REF[1:0]}}. Refer to each input interface's DC specification for the correct V_{REF[1:0]}} range.
- Voltage required to switch to a logic HIGH, single-ended operation only.
- Voltage required to switch to a logic LOW, single-ended operation only.

AC TIMING DIAGRAM

NOTE:

1. The AC TIMING DIAGRAM applies to PE = V_{DD}. For PE = GND, the negative edge of FB aligns with the negative edge of REF_[1:0], divided outputs change on the negative edge of REF_[1:0], and the positive edges of the divide-by-2 and divide-by-4 signals align.

JITTER AND OFFSET TIMING WAVEFORMS

$$t_{jit(cc)} = |t_{cycle\ n} - t_{cycle\ n+1}|$$

Cycle-to-Cycle jitter

$$t(\emptyset) = \frac{1}{N} \sum_{n=1}^N t(\emptyset)_n$$

(N is a large number of samples)

NOTE:
1. Diagram for PE = H and TxS/RxS = L.

Static Phase Offset

$$t_{JIT(DUTY)} = |tW(MAX) - tW(MIN)|$$

Duty-Cycle Jitter

$$t_{jit(per)} = \left| t_{cycle\ n} - \frac{1}{f_0} \right|$$

Period jitter

NOTE:
1. $1/f_0$ = average period.

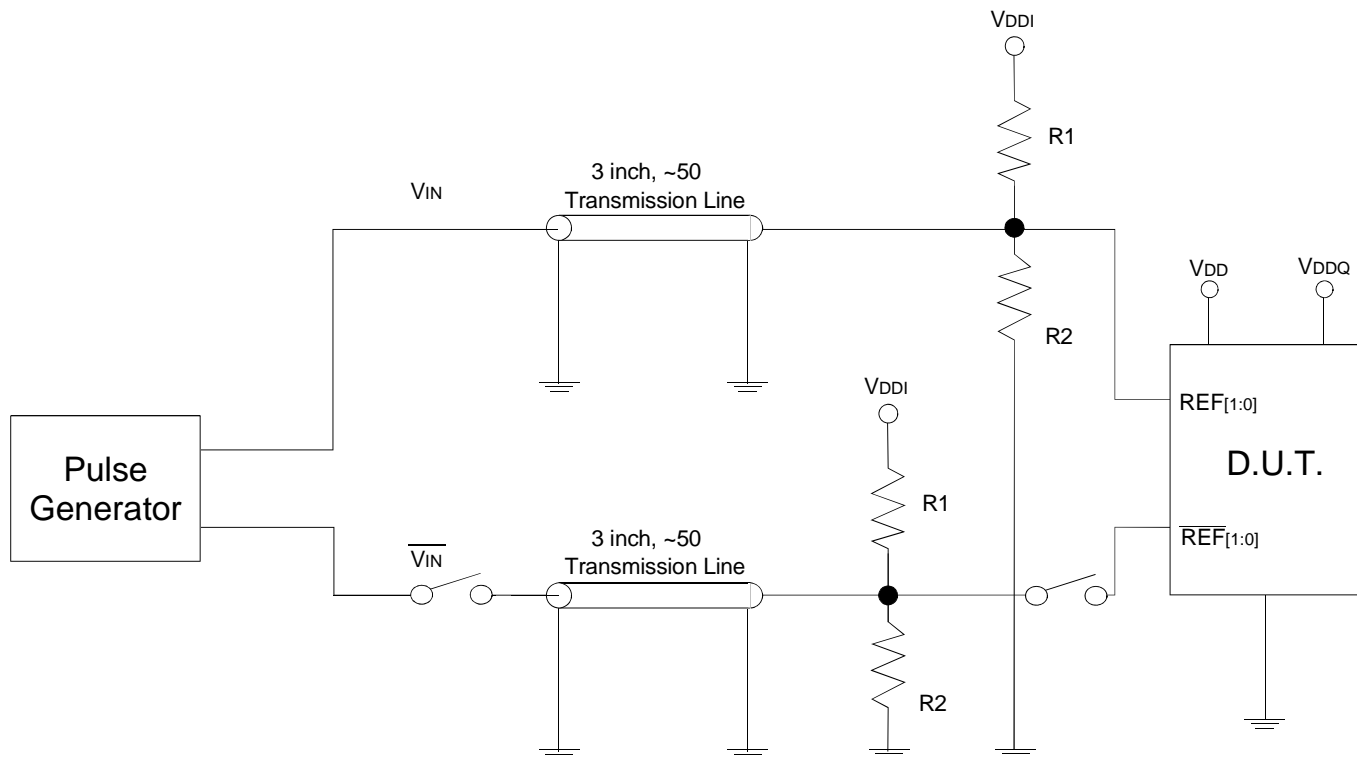

$$t_{jit(hper)} = \left| t_{half\ period\ n} - \frac{1}{2 \cdot f_0} \right|$$

Half-Period jitter

NOTE:
1. $1/f_0$ = average period.
