

128K x 36, 3.3V Synchronous *IDT71V546S/XS* SRAM with ZBT™ Feature, Burst Counter and Pipelined Outputs

Features

- ◆ 128K x 36 memory configuration, pipelined outputs
- ◆ Supports high performance system speed - 133 MHz (4.2 ns Clock-to-Data Access)
- ◆ ZBT™ Feature - No dead cycles between write and read cycles
- ◆ Internally synchronized registered outputs eliminate the need to control \overline{OE}
- ◆ Single R/W (READ/WRITE) control pin
- ◆ Positive clock-edge triggered address, data, and control signal registers for fully pipelined applications
- ◆ 4-word burst capability (interleaved or linear)
- ◆ Individual byte write ($\overline{BW1}$ - $\overline{BW4}$) control (May tie active)
- ◆ Three chip enables for simple depth expansion
- ◆ Single 3.3V power supply ($\pm 5\%$)
- ◆ Packaged in a JEDEC standard 100-pin TQFP package

Description

The IDT71V546 is a 3.3V high-speed 4,718,592-bit (4.5 Megabit) synchronous SRAM organized as 128K x 36 bits. It is designed to eliminate dead bus cycles when turning the bus around between reads and writes, or writes and reads. Thus it has been given the name ZBT™, or Zero Bus Turn-around.

Address and control signals are applied to the SRAM during one

clock cycle, and two cycles later its associated data cycle occurs, be it read or write.

The IDT71V546 contains data I/O, address and control signal registers. Output enable is the only asynchronous signal and can be used to disable the outputs at any given time.

A Clock Enable (\overline{CEN}) pin allows operation of the IDT71V546 to be suspended as long as necessary. All synchronous inputs are ignored when \overline{CEN} is high and the internal device registers will hold their previous values.

There are three chip enable pins ($\overline{CE1}$, $\overline{CE2}$, $\overline{CE3}$) that allow the user to deselect the device when desired. If any one of these three is not active when $\overline{ADV}/\overline{LD}$ is low, no new memory operation can be initiated and any burst that was in progress is stopped. However, any pending data transfers (reads or writes) will be completed. The data bus will tri-state two cycles after the chip is deselected or a write initiated.

The IDT71V546 has an on-chip burst counter. In the burst mode, the IDT71V546 can provide four cycles of data for a single address presented to the SRAM. The order of the burst sequence is defined by the \overline{LBO} input pin. The \overline{LBO} pin selects between linear and interleaved burst sequence. The $\overline{ADV}/\overline{LD}$ signal is used to load a new external address ($\overline{ADV}/\overline{LD}$ = LOW) or increment the internal burst counter ($\overline{ADV}/\overline{LD}$ = HIGH).

The IDT71V546 SRAM utilizes IDT's high-performance, high-volume 3.3V CMOS process, and is packaged in a JEDEC standard 14mm x 20mm 100-pin thin plastic quad flatpack (TQFP) for high board density.

Pin Description Summary

| | | | |
|---|--|--------|--------------|
| A0 - A16 | Address Inputs | Input | Synchronous |
| $\overline{CE1}$, $\overline{CE2}$, $\overline{CE3}$ | Three Chip Enables | Input | Synchronous |
| \overline{OE} | Output Enable | Input | Asynchronous |
| R/W | Read/Write Signal | Input | Synchronous |
| \overline{CEN} | Clock Enable | Input | Synchronous |
| $\overline{BW1}$, $\overline{BW2}$, $\overline{BW3}$, $\overline{BW4}$ | Individual Byte Write Selects | Input | Synchronous |
| CLK | Clock | Input | N/A |
| $\overline{ADV}/\overline{LD}$ | Advance Burst Address / Load New Address | Input | Synchronous |
| \overline{LBO} | Linear / Interleaved Burst Order | Input | Static |
| I/O0 - I/O31, I/OP1 - I/OP4 | Data Input/Output | I/O | Synchronous |
| VDD | 3.3V Power | Supply | Static |
| VSS | Ground | Supply | Static |

3821 tbl 01

Pin Definitions⁽¹⁾

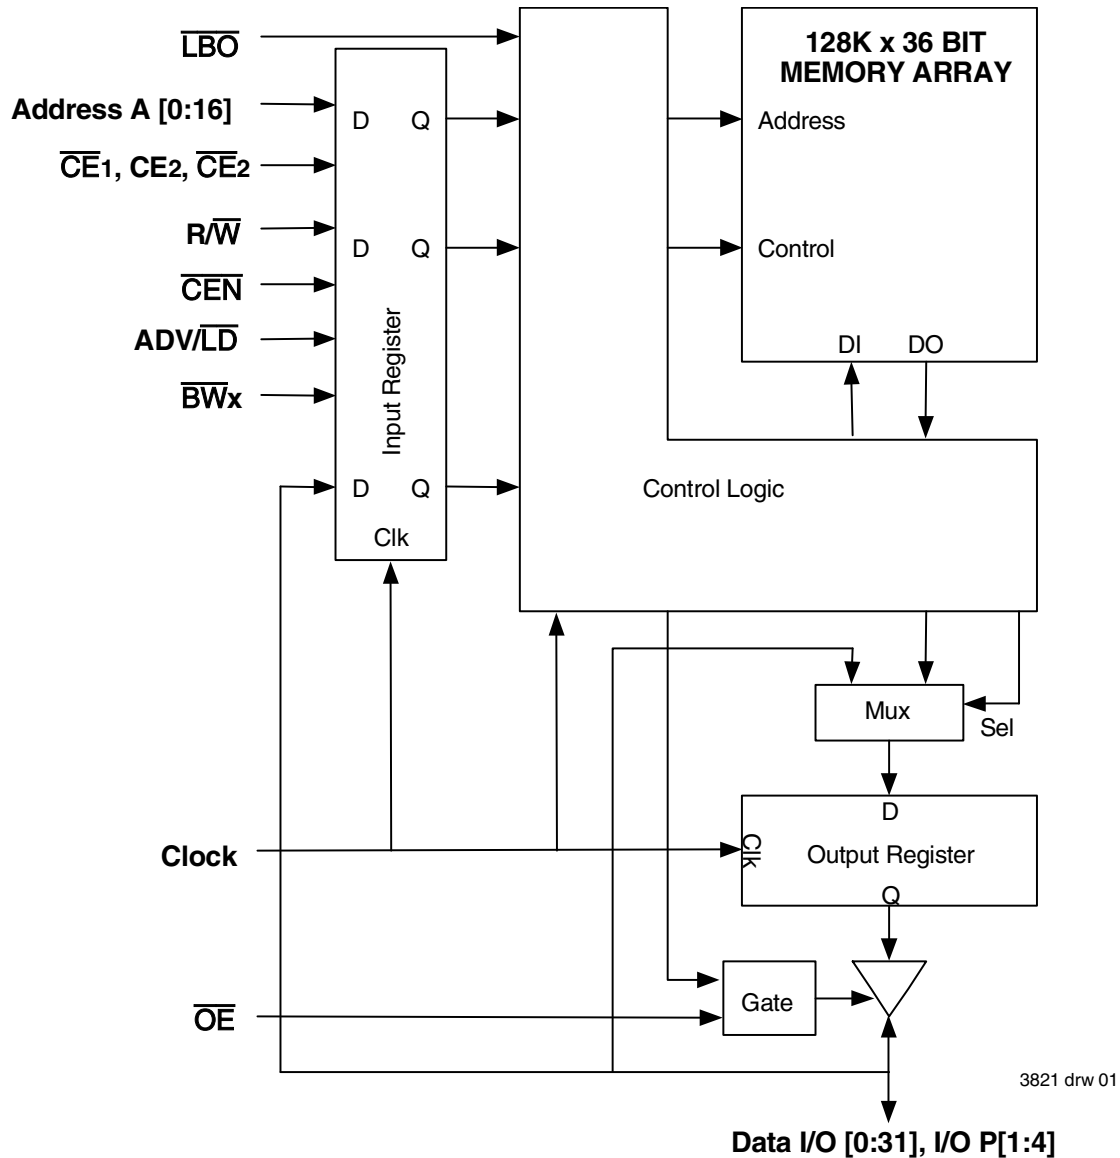

| Symbol | Pin Function | I/O | Active | Description |
|---|-------------------------------|-----|--------|---|
| A ₀ - A ₁₆ | Address Inputs | I | N/A | Synchronous Address inputs. The address register is triggered by a combination of the rising edge of CLK and ADV/LD Low, CEN Low and true chip enables. |
| ADV/LD | Address/Load | I | N/A | ADV/LD is a synchronous input that is used to load the internal registers with new address and control when it is sampled low at the rising edge of clock with the chip selected. When ADV/LD is low with the chip deselected, any burst in progress is terminated. When ADV/LD is sampled high then the internal burst counter is advanced for any burst that was in progress. The external addresses are ignored when ADV/LD is sampled high. |
| R/W | Read/Write | I | N/A | R/W signal is a synchronous input that identified whether the current load cycle initiated is a Read or Write access to the memory array. The data bus activity for the current cycle takes place two clock cycles later. |
| CEN | Clock Enable | I | LOW | Synchronous Clock Enable Input. When CEN is sampled high, all other synchronous inputs, including clock are ignored and outputs remain unchanged. The effect of CEN sampled high on the device outputs is as if the low to high clock transition did not occur. For normal operation, CEN must be sampled low at rising edge of clock. |
| BW ₁ - BW ₄ | Individual Byte Write Enables | I | LOW | Synchronous byte write enables. Enable 9-bit byte has its own active low byte write enable. On load write cycles (When R/W and ADV/LD are sampled low) the appropriate byte write signal (BW ₁ - BW ₄) must be valid. The byte write signal must also be valid on each cycle of a burst write. Byte Write signals are ignored when R/W is sampled high. The appropriate byte(s) of data are written into the device two cycles later. BW ₁ - BW ₄ can all be tied low if always doing write to the entire 36-bit word. |
| CE ₁ , CE ₂ | Chip Enables | I | LOW | Synchronous active low chip enable. CE ₁ and CE ₂ are used with CE ₂ to enable the IDT71V546. (CE ₁ or CE ₂ sampled high or CE ₂ sampled low) and ADV/LD low at the rising edge of clock, initiates a deselect cycle. the ZBT™ has a two cycle deselect, i.e., the data bus will tri-state two clock cycles after deselect is initiated. |
| CE2 | Chip Enable | I | HIGH | Synchronous active high chip enable. CE ₂ is used with CE ₁ and CE ₂ to enable the chip. CE ₂ has inverted polarity but otherwise identical to CE ₁ and CE ₂ . |
| CLK | Clock | I | N/A | This is the clock input to the IDT71V546. Except for OE, all timing references for the device are made with respect to the rising edge of CLK. |
| I/O ₀ - I/O ₃₁ I/OP ₁ - I/OP ₄ | Data Input/Output | I/O | N/A | Synchronous data input/output (I/O) pins. Both the data input path and data output path are registered and triggered by the rising edge of CLK. |
| LBO | Linear Burst Order | I | LOW | Burst order selection input. When LBO is high the Interleaved burst sequence is selected. When LBO is low the Linear burst sequence is selected. LBO is a static DC input. |
| OE | Output Enable | I | LOW | Asynchronous output enable. OE must be low to read data from the 71V546. When OE is high the I/O pins are in a high-impedance state. OE does not need to be actively controlled for read and write cycles. In normal operation, OE can be tied low. |
| VDD | Power Supply | N/A | N/A | 3.3V power supply input. |
| VSS | Ground | N/A | N/A | Ground pin. |

3821 tbl 02

NOTE:

1. All synchronous inputs must meet specified setup and hold times with respect to CLK.

Functional Block Diagram

Pin Configuration — 128K X 36

100 TQFP Top View

NOTES:

1. Pin 14 does not have to be connected directly to VDD as long as the input voltage is $\geq V_{IH}$.
2. Pins 83 and 84 are reserved for future A17 (8M) and A18 (16M) respectively.

Absolute Maximum Ratings⁽¹⁾

| Symbol | Rating | Commercial & Industrial Values | Unit |
|----------------------------------|--|--------------------------------|------|
| V _{TERM} ⁽²⁾ | Terminal Voltage with Respect to GND | -0.5 to +4.6 | V |
| V _{TERM} ⁽³⁾ | Terminal Voltage with Respect to GND | -0.5 to V _{DD} +0.5 | V |
| T _A ⁽⁴⁾ | Commercial Operating Ambient Temperature | 0 to +70 | °C |
| | Industrial Operating Ambient Temperature | -40 to +85 | °C |
| T _{BIAS} | Temperature Under Bias | -55 to +125 | °C |
| T _{STG} | Storage Temperature | -55 to +125 | °C |
| P _T | Power Dissipation | 2.0 | W |
| I _{OUT} | DC Output Current | 50 | mA |

NOTES:

3821 tbl 05

- Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- V_{DD} and Input terminals only.
- I/O terminals.
- During production testing, the case temperature equals the ambient temperature.

100 TQFP Capacitance

(T_A = +25°C, f = 1.0MHz, TQFP package)

| Symbol | Parameter ⁽¹⁾ | Conditions | Max. | Unit |
|-----------------|--------------------------|------------------------|------|------|
| C _{IN} | Input Capacitance | V _{IN} = 3dV | 5 | pF |
| C _{IO} | I/O Capacitance | V _{OUT} = 3dV | 7 | pF |

3821 tbl 06

NOTE:

- This parameter is guaranteed by device characterization, but not production tested.

Recommended DC Operating Conditions

| Symbol | Parameter | Min. | Typ. | Max. | Unit |
|--------------------------------|-----------------------------|---------------------|------|-------------------------------------|------|
| V _{DD} ⁽³⁾ | Supply Voltage | 3.135 | 3.3 | 3.465 | V |
| V _{SS} | Ground | 0 | 0 | 0 | V |
| V _{IH} | Input High Voltage - Inputs | 2.0 | — | 4.6 | V |
| V _{IH} | Input High Voltage - I/O | 2.0 | — | V _{DD} +0.3 ⁽²⁾ | V |
| V _{IL} | Input Low Voltage | -0.5 ⁽¹⁾ | — | 0.8 | V |

3821 tbl 04

NOTES:

- V_{IL} (min.) = -1.0V for pulse width less than t_{CVZ}/2, once per cycle.
- V_{IH} (max.) = +6.0V for pulse width less than t_{CVZ}/2, once per cycle.
- V_{DD} needs to be ramped up smoothly to the operating level. If there are any glitches on V_{DD} that cause the voltage level to drop below 2.0 volts then the device needs to be reset by holding V_{DD} to 0.0 volts for a minimum of 100 ms.

Recommended Operating Temperature and Supply Voltage

| Grade | Ambient Temperature ⁽¹⁾ | V _{SS} | V _{DD} |
|------------|------------------------------------|-----------------|-----------------|
| Commercial | 0°C to +70°C | 0V | 3.3V±5% |
| Industrial | -40°C to +85°C | 0V | 3.3V±5% |

3821 tbl 03

NOTES:

- During production testing, the case temperature equals the ambient temperature.

Synchronous Truth Table⁽¹⁾

| \overline{CEN} | R/ \overline{W} | Chip ⁽⁶⁾ Enable | ADV/ \overline{LD} | \overline{BW}_x | ADDRESS USED | PREVIOUS CYCLE | CURRENT CYCLE | I/O (2 cycles later) |
|------------------|-------------------|-------------------------------|----------------------|-------------------|-----------------|----------------------------|---|-------------------------|
| L | L | Select | L | Valid | External | X | LOAD WRITE | D ⁽⁷⁾ |
| L | H | Select | L | X | External | X | LOAD READ | Q ⁽⁷⁾ |
| L | X | X | H | Valid | Internal | LOAD WRITE/ BURST WRITE | BURST WRITE (Advance Burst Counter) ⁽²⁾ | D ⁽⁷⁾ |
| L | X | X | H | X | Internal | LOAD READ/ BURST READ | BURST READ (Advance Burst Counter) ⁽²⁾ | Q ⁽⁷⁾ |
| L | X | Deselect | L | X | X | X | DESELECT or STOP ⁽³⁾ | HiZ |
| L | X | X | H | X | X | DESELECT / NOOP | NOOP | HiZ |
| H | X | X | X | X | X | X | SUSPEND ⁽⁴⁾ | Previous Value |

3821 tbl 07

NOTES:

1. L = V_{IL}, H = V_{IH}, X = Don't Care.
2. When ADV/ \overline{LD} signal is sampled high, the internal burst counter is incremented. The R/ \overline{W} signal is ignored when the counter is advanced. Therefore the nature of the burst cycle (Read or Write) is determined by the status of the R/ \overline{W} signal when the first address is loaded at the beginning of the burst cycle.
3. Deselect cycle is initiated when either (\overline{CE}_1 , or \overline{CE}_2 is sampled high or \overline{CE}_2 is sampled low) and ADV/ \overline{LD} is sampled low at rising edge of clock. The data bus will tri-state two cycles after deselect is initiated.
4. When \overline{CEN} is sampled high at the rising edge of clock, that clock edge is blocked from propagating through the part. The state of all the internal registers and the I/Os remains unchanged.
5. To select the chip requires $\overline{CE}_1 = L$, $\overline{CE}_2 = L$, $\overline{CE}_2 = H$ on these chip enables. Chip is deselected if either one of the chip enables is false.
6. Device Outputs are ensured to be in High-Z after the first rising edge of clock upon power-up.
7. Q - Data read from the device, D - data written to the device.

Partial Truth Table for Writes⁽¹⁾

| Operation | R/ \overline{W} | \overline{BW}_1 | \overline{BW}_2 | \overline{BW}_3 | \overline{BW}_4 |
|---|-------------------|-------------------|-------------------|-------------------|-------------------|
| READ | H | X | X | X | X |
| WRITE ALL BYTES | L | L | L | L | L |
| WRITE BYTE 1 (I/O [0:7], I/O _{P1}) ⁽²⁾ | L | L | H | H | H |
| WRITE BYTE 2 (I/O [8:15], I/O _{P2}) ⁽²⁾ | L | H | L | H | H |
| WRITE BYTE 3 (I/O [16:23], I/O _{P3}) ⁽²⁾ | L | H | H | L | H |
| WRITE BYTE 4 (I/O [24:31], I/O _{P4}) ⁽²⁾ | L | H | H | H | L |
| NO WRITE | L | H | H | H | H |

3821 tbl 08

NOTES:

1. L = V_{IL}, H = V_{IH}, X = Don't Care.
2. Multiple bytes may be selected during the same cycle.

Interleaved Burst Sequence Table ($\overline{\text{LBO}} = V_{DD}$)

| | Sequence 1 | | Sequence 2 | | Sequence 3 | | Sequence 4 | |
|-------------------------------|------------|----|------------|----|------------|----|------------|----|
| | A1 | A0 | A1 | A0 | A1 | A0 | A1 | A0 |
| First Address | 0 | 0 | 0 | 1 | 1 | 0 | 1 | 1 |
| Second Address | 0 | 1 | 0 | 0 | 1 | 1 | 1 | 0 |
| Third Address | 1 | 0 | 1 | 1 | 0 | 0 | 0 | 1 |
| Fourth Address ⁽¹⁾ | 1 | 1 | 1 | 0 | 0 | 1 | 0 | 0 |

3821 tbl 09

NOTE:

- Upon completion of the Burst sequence the counter wraps around to its initial state and continues counting.

Linear Burst Sequence Table ($\overline{\text{LBO}} = V_{SS}$)

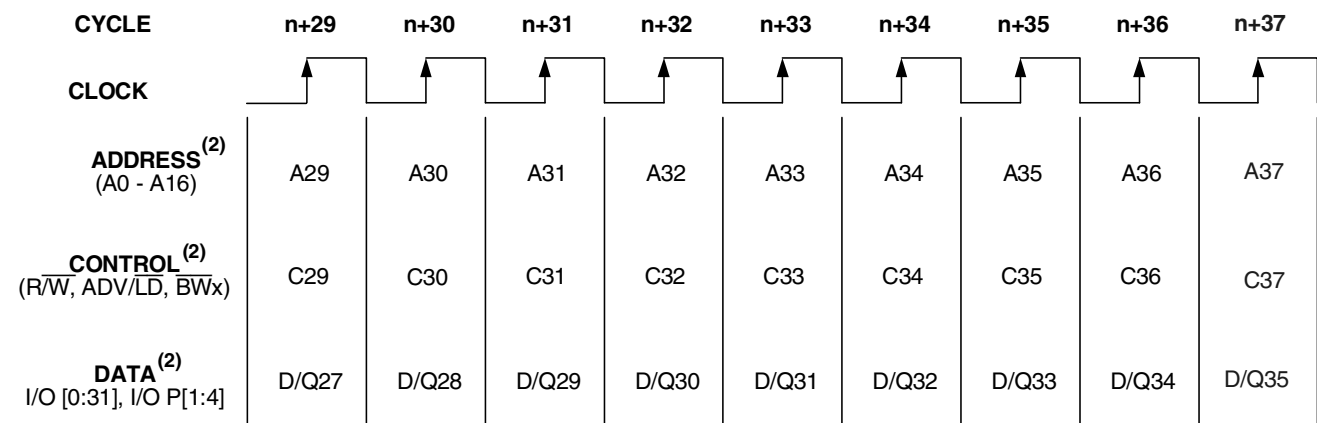

| | Sequence 1 | | Sequence 2 | | Sequence 3 | | Sequence 4 | |
|-------------------------------|------------|----|------------|----|------------|----|------------|----|
| | A1 | A0 | A1 | A0 | A1 | A0 | A1 | A0 |
| First Address | 0 | 0 | 0 | 1 | 1 | 0 | 1 | 1 |
| Second Address | 0 | 1 | 1 | 0 | 1 | 1 | 0 | 0 |
| Third Address | 1 | 0 | 1 | 1 | 0 | 0 | 0 | 1 |
| Fourth Address ⁽¹⁾ | 1 | 1 | 0 | 0 | 0 | 1 | 1 | 0 |

3821 tbl 10

NOTE:

- Upon completion of the Burst sequence the counter wraps around to its initial state and continues counting.

Functional Timing Diagram⁽¹⁾

NOTE:

3821 drw 03

- This assumes $\overline{\text{CEN}}$, $\overline{\text{CE1}}$, CE2 , $\overline{\text{CE2}}$ are all true.
- All Address, Control and Data_In are only required to meet set-up and hold time with respect to the rising edge of clock. Data_Out is valid after a clock-to-data delay from the rising edge of clock.

Device Operation - Showing Mixed Load, Burst, Deselect and NOOP Cycles⁽²⁾

| Cycle | Address | R/W | ADV/LD | $\overline{CE}^{(1)}$ | \overline{CEN} | \overline{BW}_x | \overline{OE} | I/O | Comments |

3821 tbl 18

NOTES:

1. H = High; L = Low; X = Don't Care; ? = Don't Know; Z = High Impedance.
2. $\overline{CE} = L$ is defined as $\overline{CE1} = L$, $\overline{CE2} = L$ and $CE2 = H$. $\overline{CE} = H$ is defined as $\overline{CE1} = H$, $\overline{CE2} = H$ or $CE2 = L$.
3. Device Outputs are ensured to be in High-Z after the first rising edge of clock upon power-up.

Write Operation With Chip Enable Used⁽¹⁾

| Cycle | Address | R/ \overline{W} | ADV/ \overline{LD} | $\overline{CE}^{(1)}$ | \overline{CEN} | \overline{BW}_x | \overline{OE} | I/O | Comments |
|-------|---------|-------------------|----------------------|-----------------------|------------------|-------------------|-----------------|-----|---------------------------------|

3821 tbl 19

NOTES:

1. H = High; L = Low; X = Don't Care; ? = Don't Know; Z = High Impedance.
2. $\overline{CE} = L$ is defined as $\overline{CE1} = L$, $\overline{CE2} = L$ and $CE2 = H$. $\overline{CE} = H$ is defined as $\overline{CE1} = H$, $\overline{CE2} = H$ or $CE2 = L$.

DC Electrical Characteristics Over the Operating Temperature and Supply Voltage Range ($V_{DD} = 3.3V \pm 5\%$)

| Symbol | Parameter | Test Conditions | Min. | Max. | Unit |
|------------------|--|---|------|------|---------|
| $ I_{LI} $ | Input Leakage Current | $V_{DD} = \text{Max.}, V_{IN} = 0V \text{ to } V_{DD}$ | — | 5 | μA |
| $ I_{L\bar{L}} $ | \bar{LBO} Input Leakage Current ⁽¹⁾ | $V_{DD} = \text{Max.}, V_{IN} = 0V \text{ to } V_{DD}$ | — | 30 | μA |
| $ I_{LO} $ | Output Leakage Current | $\bar{CE} \geq V_{IH}$ or $\bar{OE} \geq V_{IH}, V_{OUT} = 0V \text{ to } V_{DD}, V_{DD} = \text{Max.}$ | — | 5 | μA |
| V_{OL} | Output Low Voltage | $I_{OL} = 5mA, V_{DD} = \text{Min.}$ | — | 0.4 | V |
| V_{OH} | Output High Voltage | $I_{OH} = -5mA, V_{DD} = \text{Min.}$ | 2.4 | — | V |

NOTE:

3821 tbl 20

- The \bar{LBO} pin will be internally pulled to V_{DD} if it is not actively driven in the application.

DC Electrical Characteristics Over the Operating Temperature and Supply Voltage Range⁽¹⁾ ($V_{DD} = 3.3V \pm 5\%$, $V_{HD} = V_{DD} - 0.2V$, $V_{LD} = 0.2V$)

| Symbol | Parameter | Test Conditions | S133 | | S117 | | S100 | | Unit |
|-----------|------------------------------------|--|-------|-----|-------|-----|-------|-----|------|
| | | | Com'l | Ind | Com'l | Ind | Com'l | Ind | |
| I_{DD} | Operating Power Supply Current | Device Selected, Outputs Open, $ADV/LD = X, V_{DD} = \text{Max.}, V_{IN} \geq V_{IH}$ or $\leq V_{IL}, f = f_{MAX}^{(2)}$ | 300 | 310 | 275 | 285 | 250 | 260 | mA |
| I_{SB1} | CMOS Standby Power Supply Current | Device Deselected, Outputs Open, $V_{DD} = \text{Max.}, V_{IN} \geq V_{HD}$ or $\leq V_{LD}, f = 0^{(2)}$ | 40 | 45 | 40 | 45 | 40 | 45 | mA |
| I_{SB2} | Clock Running Power Supply Current | Device Deselected, Outputs Open, $V_{DD} = \text{Max.}, V_{IN} \geq V_{HD}$ or $\leq V_{LD}, f = f_{MAX}^{(2)}$ | 110 | 120 | 105 | 115 | 100 | 110 | mA |
| I_{SB3} | Idle Power Supply Current | Device Selected, Outputs Open, $CEN \geq V_{IH}, V_{DD} = \text{Max.}, V_{IN} \geq V_{HD}$ or $\leq V_{LD}, f = f_{MAX}^{(2)}$ | 40 | 45 | 40 | 45 | 40 | 45 | mA |

NOTES:

3821 tbl 21

- All values are maximum guaranteed values.
- At $f = f_{MAX}$, inputs are cycling at the maximum frequency of read cycles of 1/tcyc; $f=0$ means no input lines are changing.

AC Test Loads

Figure 1. AC Test Load

AC Test Conditions

| t _{HB} | Byte Write Enable (BWx) Hold Time | 0.5 | — | 0.5 | — | 0.5 | — | ns |

NOTES:

- t_F = 1/t_{CYC}.
- Measured as HIGH above 2.0V and LOW below 0.8V.
- Transition is measured ±200mV from steady-state.
- These parameters are guaranteed with the AC load (Figure 1) by device characterization. They are not production tested.
- To avoid bus contention, the output buffers are designed such that t_{CHZ} (device turn-off) is about 2 ns faster than t_{CLZ} (device turn-on) at a given temperature and voltage. The specs as shown do not imply bus contention because t_{CLZ} is a Min. parameter that is worse case at totally different test conditions (0 deg. C, 3.465V) than t_{CHZ}, which is a Max. parameter (worse case at 70 deg. C, 3.135V).

3821 tbl 23

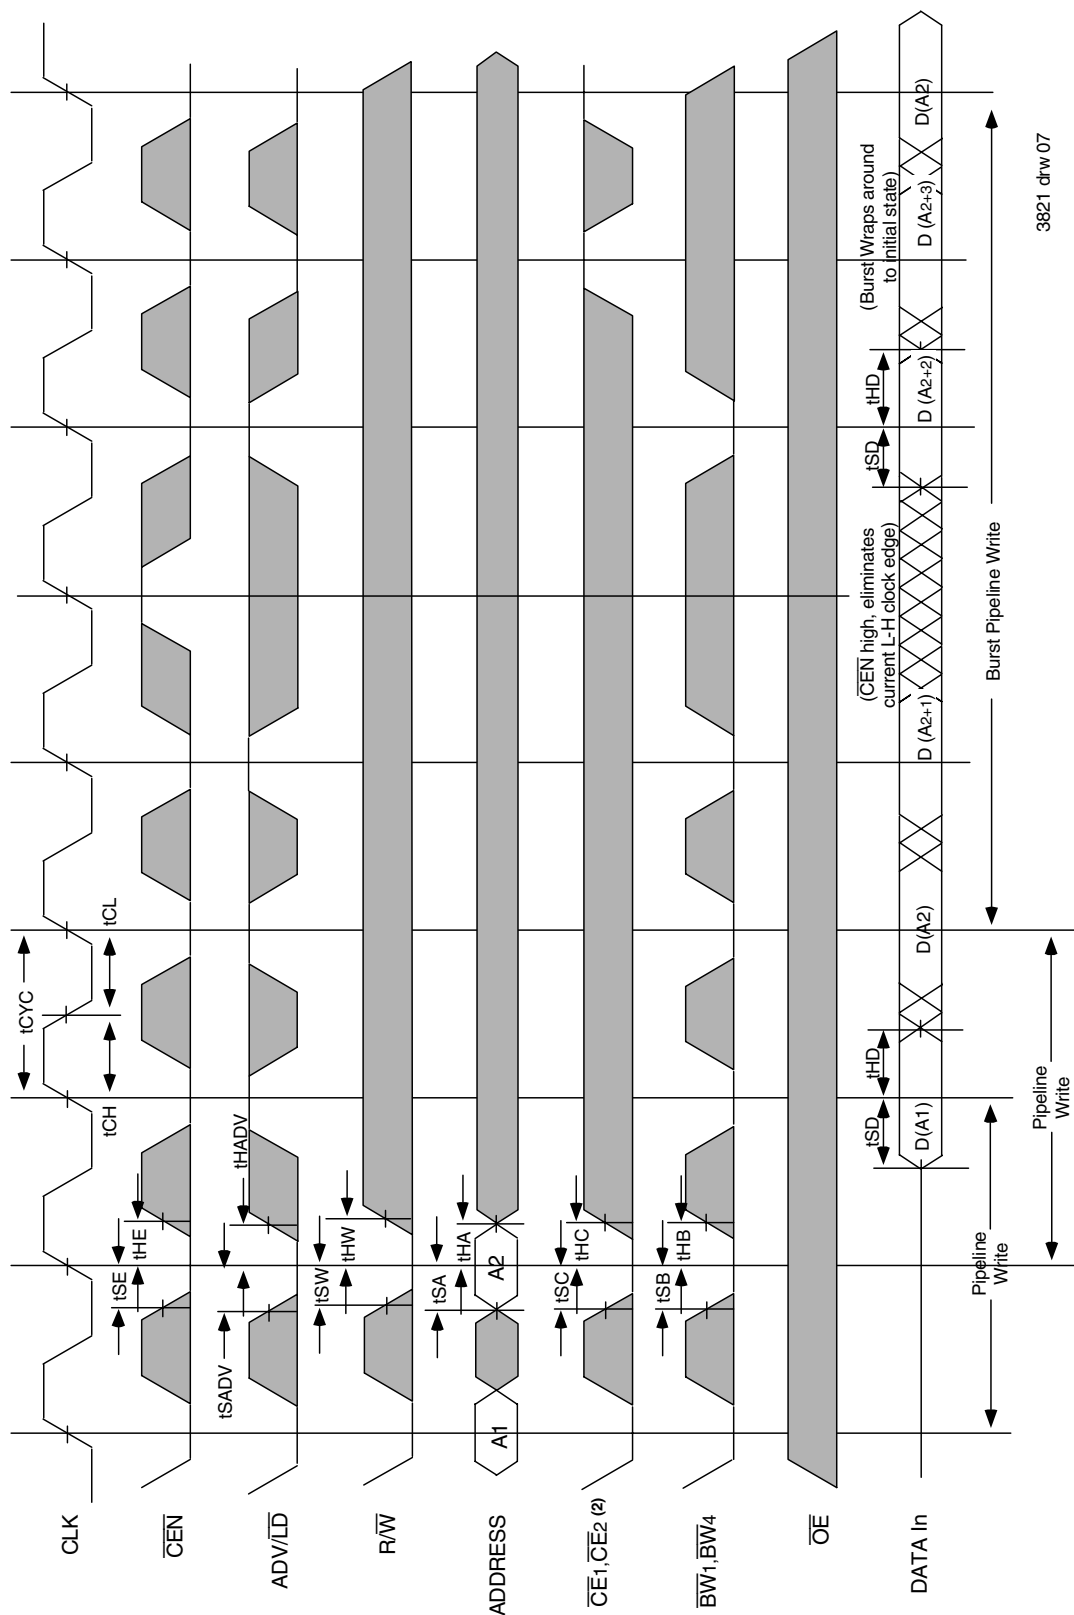

Timing Waveform of Read Cycle^(1,2,3,4)

NOTES:

1. $Q(A1)$ represents the first output from the external address $A1$. $Q(A2)$ represents the first output from the external address $A2$. $Q(A2+1)$ represents the next output data in the burst sequence of the base address $A2$, etc. where address bits $A0$ and $A1$ are advancing for the four word burst in the sequence defined by the state of the \overline{LBO} input.
2. $CE2$ timing transitions are identical but inverted to the $\overline{CE1}$ and $\overline{CE2}$ signals. For example, when $\overline{CE1}$ and $\overline{CE2}$ are LOW on this waveform, $CE2$ is HIGH.
3. Burst ends when new address and control are loaded into the SRAM by sampling ADV/LD LOW.
4. \overline{RW} is don't care when the SRAM is bursting (ADV/LD sampled HIGH). The nature of the burst access (Read or Write) is fixed by the state of the \overline{RW} signal when new address and control are loaded into the SRAM.

Timing Waveform of Write Cycles^(1,2,3,4,5)

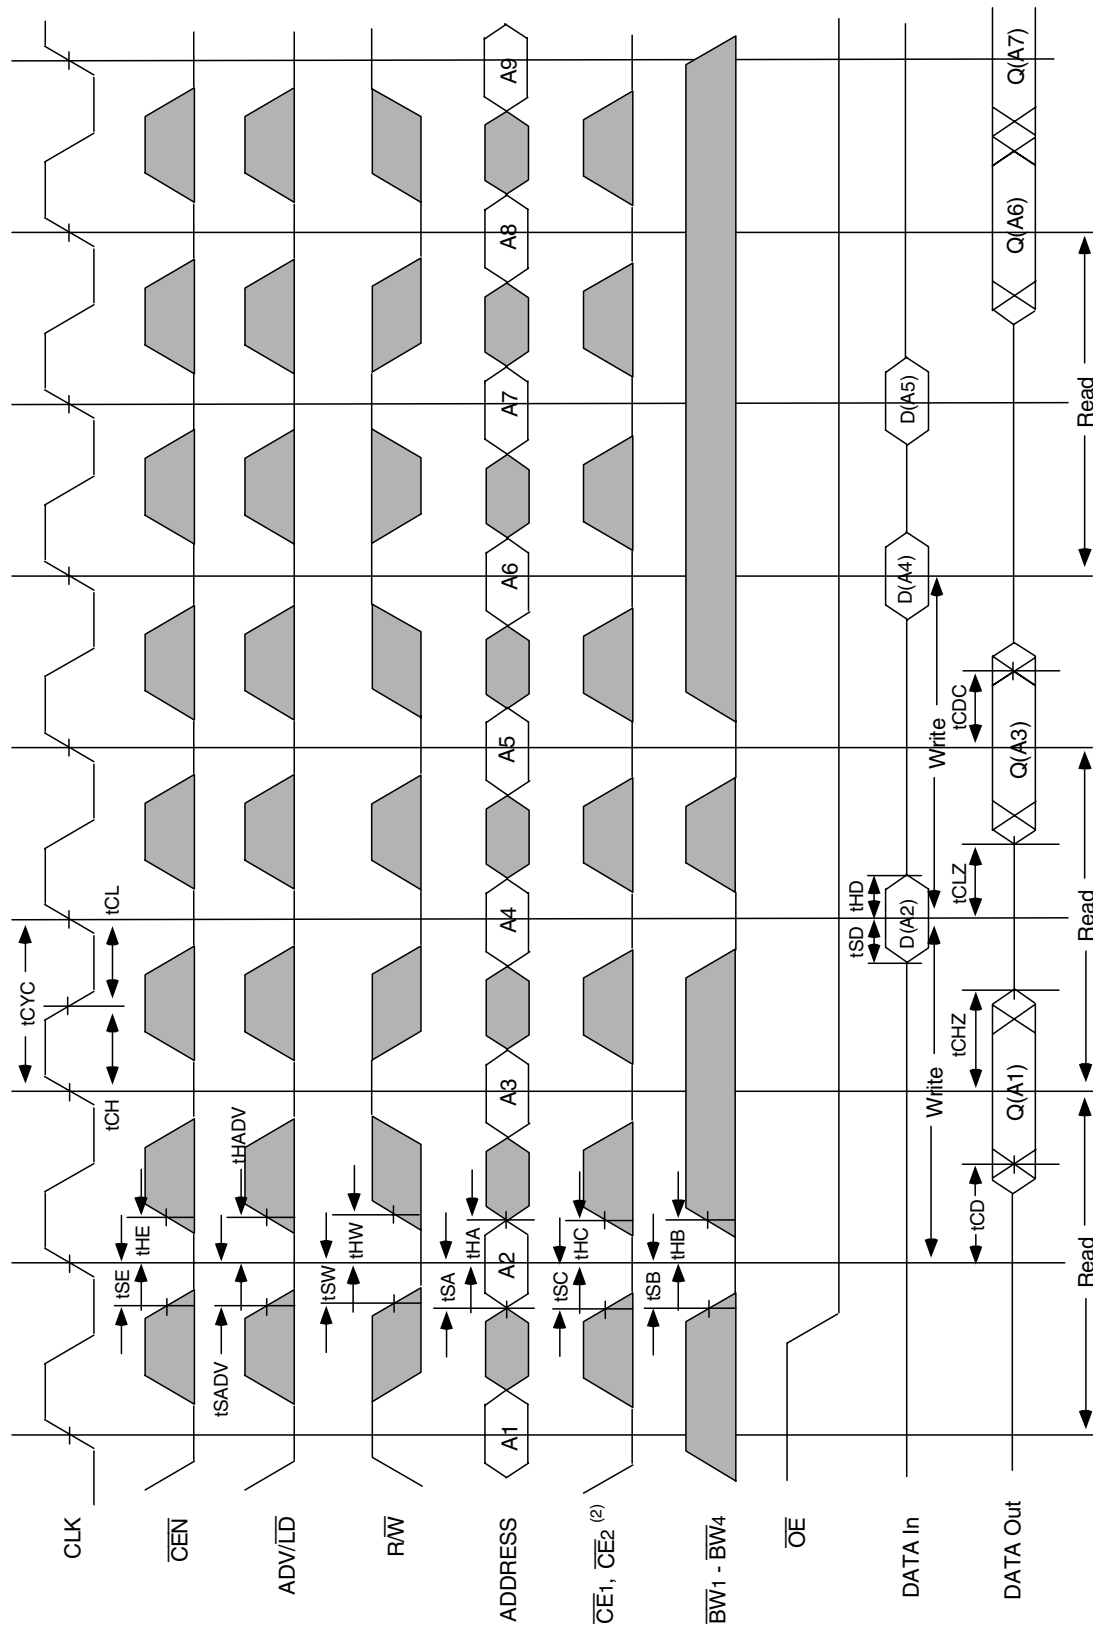

3821 drw 07

NOTES:

1. D(A1) represents the first input to the external address A1. D(A2) represents the first input to the external address A2. D(A2+1) represents the next input data in the burst sequence of the base address A2, etc. where address bits A0 and A1 are advancing for the four word burst in the sequence defined by the state of the LBO input.
2. CE2 timing transitions are identical but inverted to the CE1 and CE2 signals. For example, when CE1 and CE2 are LOW on this waveform, CE2 is HIGH.
3. Burst ends when new address and control are loaded into the SRAM by sampling ADV/LD LOW.
4. R/W is don't care when the SRAM is bursting (ADV/LD sampled HIGH). The nature of the burst access (Read or Write) is fixed by the state of the R/W signal when new address and control are loaded into the SRAM.
5. Individual Byte Write signals (BWx) must be valid on all write and burst-write cycles. A write cycle is initiated when R/W signal is sampled LOW. The byte write information comes in two cycles before the actual data is presented to the SRAM.

Timing Waveform of Combined Read and Write Cycles^(1,2,3)

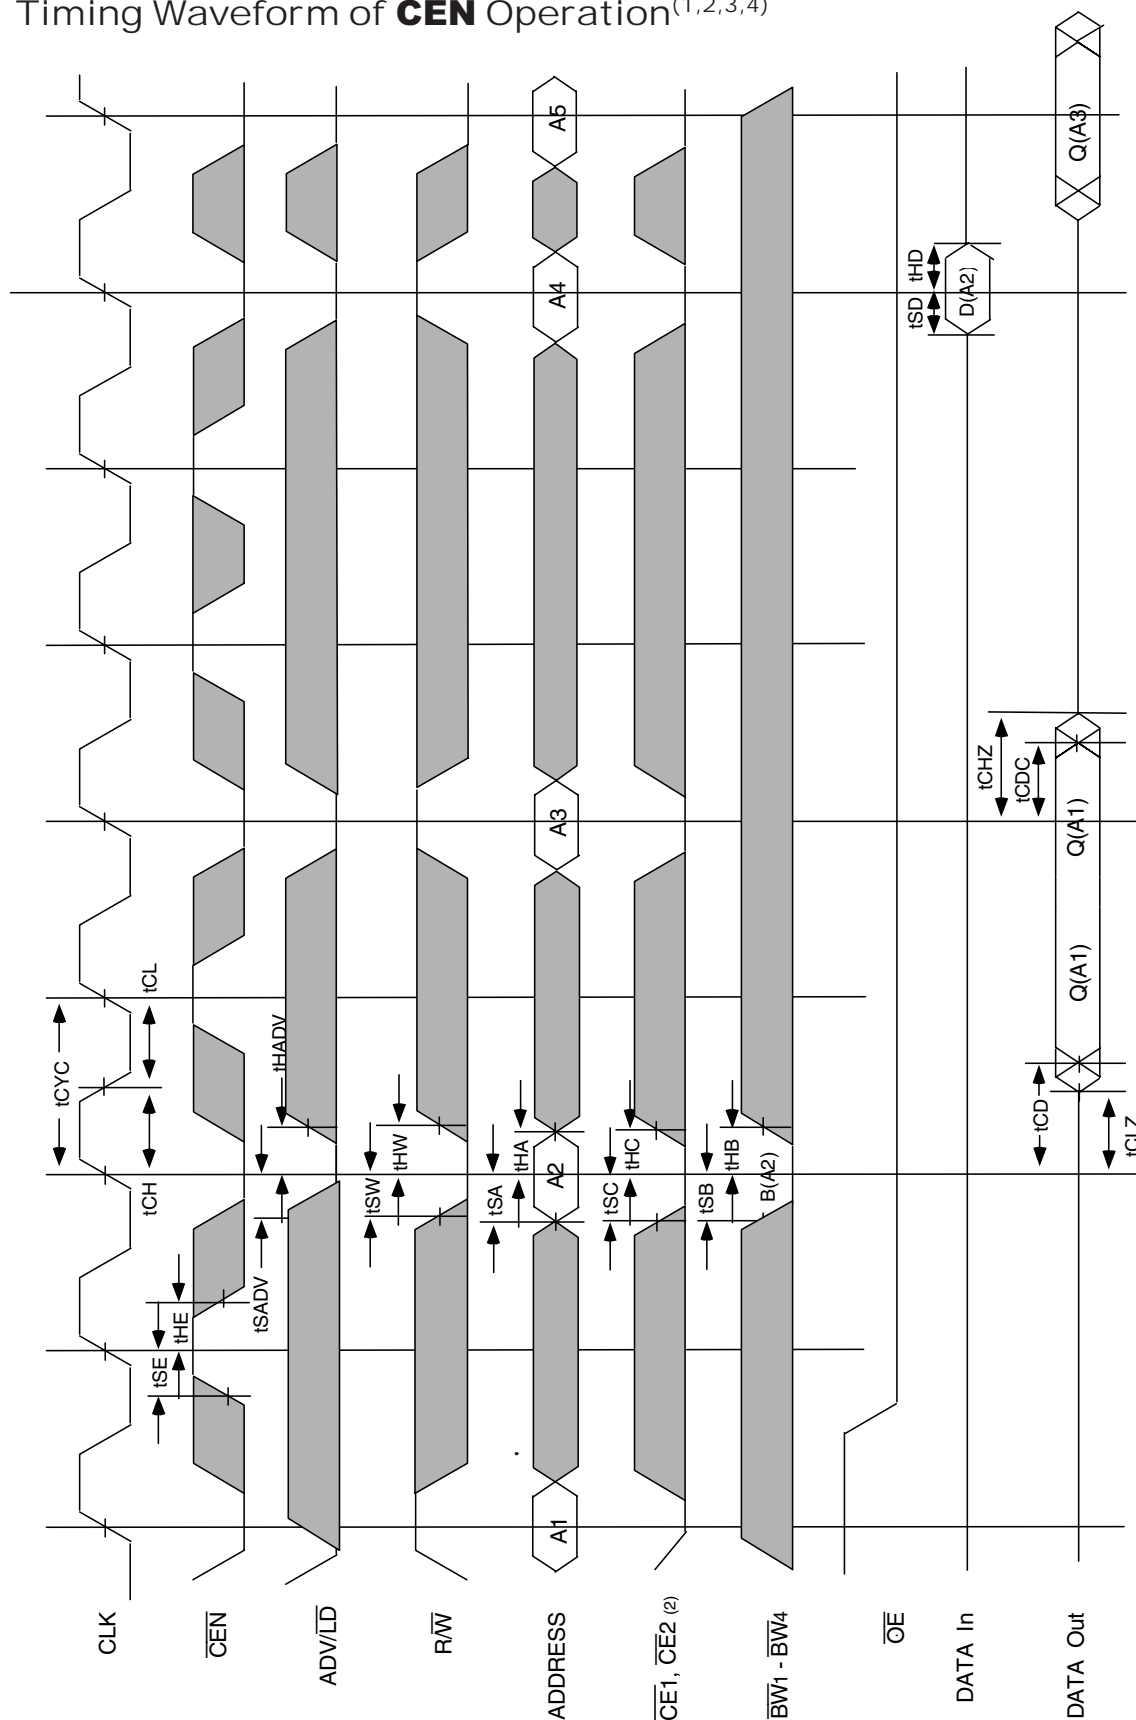

3821 drw 08

NOTES:

1. Q (A1) represents the first output from the external address A1. D (A2) represents the input data to the SRAM corresponding to address A2.
2. CE2 timing transitions are identical but inverted to the CE1 and OE2 signals. For example, when CE1 and OE2 are LOW on this waveform, CE2 is HIGH.
3. Individual Byte Write signals (BWx) must be valid on all write and burst-write cycles. A write cycle is initiated when RW signal is sampled LOW. The byte write information comes in two cycles before the actual data is presented to the SRAM.

Timing Waveform of **CEN** Operation^(1,2,3,4)

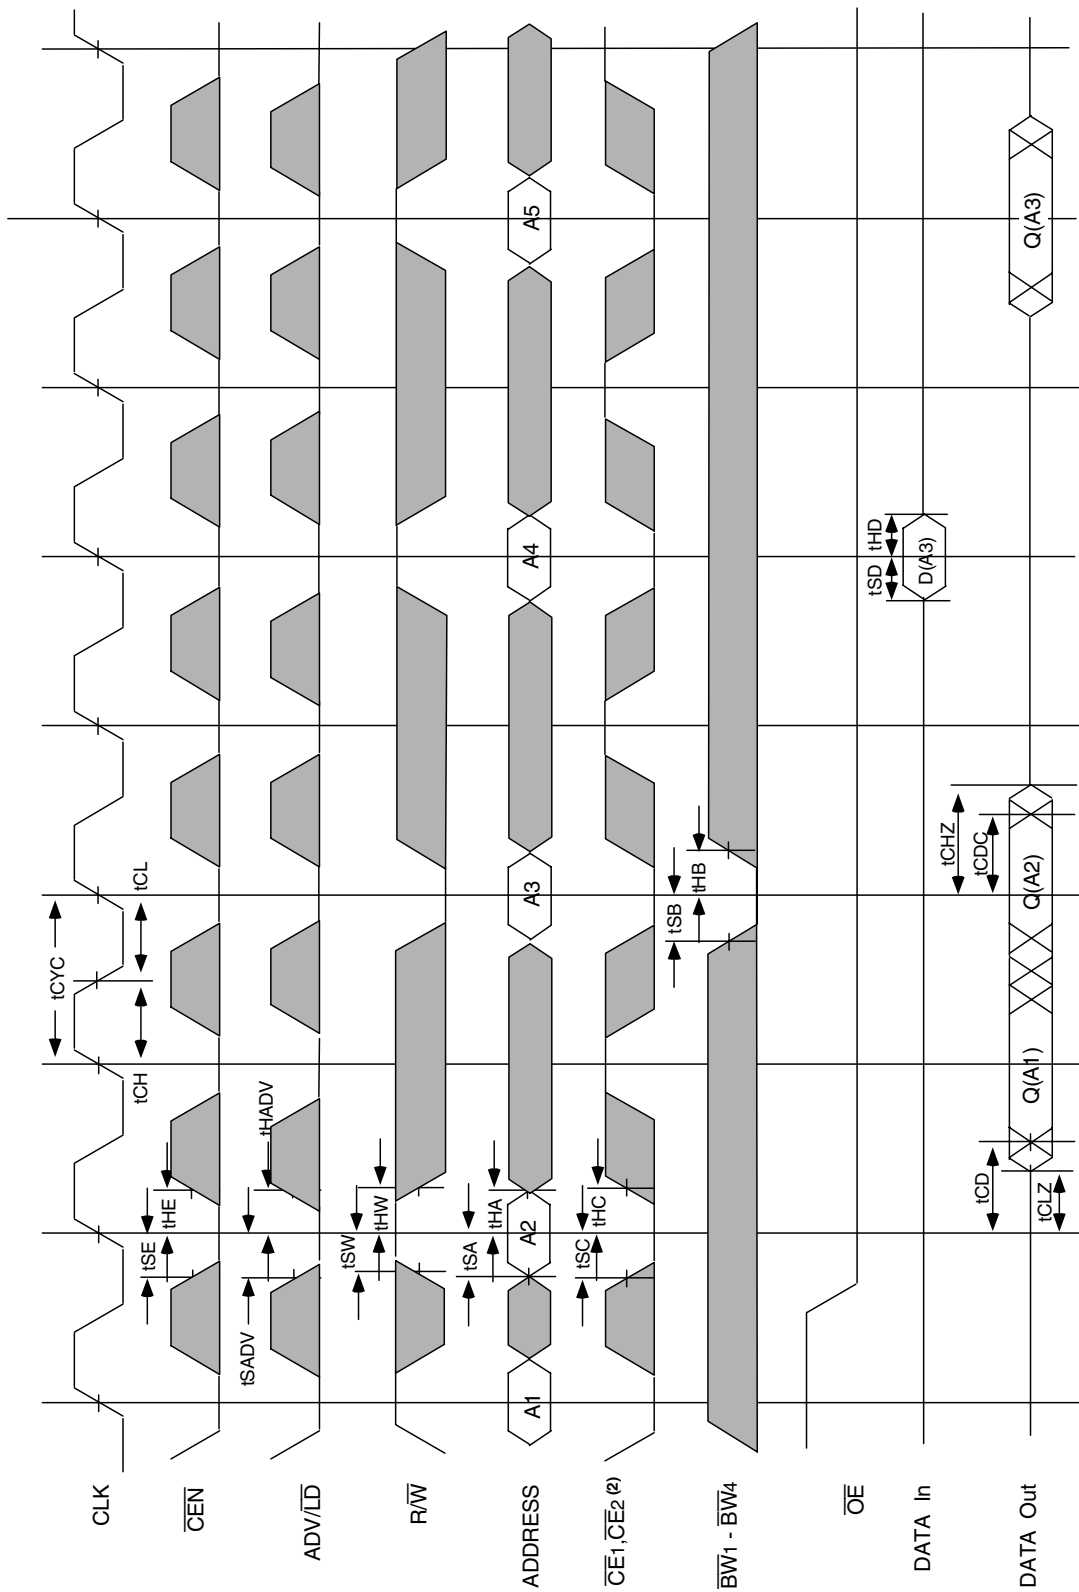

3821 drw 09

NOTES:

1. Q (A1) represents the first output from the external address A1. D (A2) represents the input data to the SRAM corresponding to address A2.
2. CE2 timing transitions are identical but inverted to the CE1 and CEN signals. For example, when CE1 and CEN are LOW on this waveform, CE2 is HIGH.
3. CEN when sampled high on the rising edge of clock will block that L-H transition of the clock from propagating into the SRAM. The part will behave as if the L-H clock transition did not occur. All internal registers in the SRAM will retain their previous state.
4. Individual Byte Write signals (BWx) must be valid on all write and burst-write cycles. A write cycle is initiated when RW signal is sampled LOW. The byte write information comes in two cycles before the actual data is presented to the SRAM.

Timing Waveform of $\overline{\text{CS}}$ Operation^(1,2,3,4)

3821 drw 10

NOTES:

1. Q (A1) represents the first output from the external address A1. D (A3) represents the input data to the SRAM corresponding to address A3 etc.
2. CE2 timing transitions are identical but inverted to the $\overline{\text{CE1}}$ and $\overline{\text{CE2}}$ signals. For example, when $\overline{\text{CE1}}$ and $\overline{\text{CE2}}$ are LOW on this waveform, $\overline{\text{CE2}}$ is HIGH.
3. When either one of the Chip enables ($\overline{\text{CE1}}$, $\overline{\text{CE2}}$) is sampled inactive at the rising clock edge, a deselect cycle is initiated. The data-bus tri-states two cycles after the initiation of the deselect cycle. This allows for any pending data transfers (reads or writes) to be completed.
4. Individual Byte Write signals ($\overline{\text{BWx}}$) must be valid on all write and burst-write cycles. A write cycle is initiated when $\overline{\text{RW}}$ signal is sampled LOW. The byte write information comes in two cycles before the actual data is presented to the SRAM.

Timing Waveform of \overline{OE} Operation⁽¹⁾

NOTE:

1. A read operation is assumed to be in progress.
