

1.5 A, 1.5 MHz adjustable, step-down switching regulator

Datasheet - production data

DFN6D (3 x 3 mm)

Features

- Step-down current mode PWM (1.5 MHz) DC-DC converter
- 2% DC output voltage tolerance
- Internal soft-start for STARTUP current limitation and power on delay of 50 - 100 μ s
- Typical efficiency: > 70% over all operating conditions
- 1.5 A output current capability
- Not switching quiescent current: max 2.5 mA over temperature range
- Switch V_{DS} : max. 350 mV at $I_{SW} = 750$ mA
- Uses tiny capacitors and inductors
- Available in DFN6D 3 x 3 mm package with exposed pad

Description

The ST1S03 is a step-down DC-DC converter optimized for powering a low voltage digital core in HDD applications and, generally, to replace the high current linear solution when the power dissipation may cause a high heating of the application environment. It provides up to 1.5 A over an input voltage range of 3 V to 16 V. A high switching frequency (1.5 MHz) allows the use of tiny surface-mount components: as well as the resistor divider to set the output voltage value, only an inductor, a Schottky diode and two capacitors are required. Besides, a low output ripple is guaranteed by the current mode PWM topology and by the use of low ESR SMD ceramic capacitors. The device is thermal protected and current limited to prevent damages due to an accidental short-circuit. The ST1S03 device is available in a DFN6D package.

Table 2. Pin description

Pin no.	Symbol	Name and function
1	V_{FB}	Voltage of feedback
2	GND	System ground
3	SW	Output of the internal power switch
4	V_{IN_SW}	Power supply for the MOSFET switch
5	V_{IN_A}	Power supply for the analog circuit
6	N.C.	Not connected
7	EP	Exposed pad should be connected to GND

3 Maximum ratings

Table 3. Absolute maximum ratings

Symbol	Parameter	Value	Unit
V_{IN_SW}	Positive power supply voltage	-0.3 to 16	V
V_{IN_A}	Positive power supply voltage	-0.3 to 16	V
SWITCH voltage	Max voltage of output pin	-0.3 to 16	V
V_{FB}	Feedback voltage	2.5	V
I_{VFB}	Common mode input voltage	± 1	mA
T_J	Max junction temperature	150	°C
T_{STG}	Storage temperature range	-25 to 150	°C
T_{LEAD}	Lead temperature (soldering) 10 s	300	°C

Note: Absolute maximum ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied.

Table 4. Thermal data

Symbol	Parameter	Value	Unit
R_{thJC}	Thermal resistance junction case	10	°C/W
R_{thJA}	Thermal resistance junction ambient	55	°C/W

4 Electrical characteristics

$\Delta V_O/\Delta I_O$ at $I_O = \text{short}$	Short-circuit removal response ⁽¹⁾	$I_O = 10\text{ mA to short}$, $T_A = 25\text{ }^\circ\text{C}$			+5	$\% V_O$

1. Guaranteed by design, but not tested in production.

5 Application notes

The ST1S03 is an adjustable current mode PWM step-down DC-DC converter with an internal 1.5 A power switch, housed in a 6-lead DFN 3 x 3 mm package.

It's a complete 1.5 A switching regulator with its internal compensation eliminating an additional component.

The constant frequency, current mode, PWM architecture and stable operation with ceramic capacitors results in a low, predictable output ripple. However, in order to keep the output regulated, the device goes in pulse skipping mode when a very light load is required.

To clamp the error amplifier reference voltage, a soft-start control block generating a voltage ramp has been implemented. Besides an on-chip power on reset of 50 = 100 μ s ensures the proper operation when switching on the power supply. Other circuits fitted to the device protection are the thermal shutdown blocks which turn off the regulator when the junction temperature exceeds 150 °C typically and the cycle-by-cycle current limiting that provides protection against shorted outputs.

Being the ST1S03 an adjustable regulator, the output voltage is determined by an external resistor divider. The desired value is given by the following equation:

$$V_O = V_{FB} [1 + R1 / R2]$$

To make the device working, only other four external components are required: a Schottky diode, an inductor and two capacitors. The chosen inductor must be able to not saturate at the peak current level. Besides, its value can be selected keeping in account that a large inductor value increases the efficiency at a low output current and reduces an output voltage ripple, while a smaller inductor can be chosen when it is important to reduce the package size and the total cost of the application. Finally, the ST1S03 device has been designed to work properly with the X5R or X7R SMD ceramic capacitors both at the input and at the output. This kind of capacitors, thanks to their very low series resistance (ESR), minimize the output voltage ripple. Other low ESR capacitors can be used according to the need of the application without invalidating the right functioning of the device. Due to the high switching frequency and peak current, it is important to optimize the application environment reducing the length of the PCB traces and placing all the external components near the device.
