Linear Magnetic Field Sensors

SPECIFICATIONS

- ◆ **AMR sensor**
- ◆ **Very high sensitivity**
- ◆ **Almost no hysteresis**
- ◆ **Various applications**
- ◆ **Available with internal magnet**
- ◆ **Available in several packages**

Due to its featured properties - high sensitivity and almost no hysteresis – the **KMY / KMZ** sensors are used in a wide range of applications, like magnetic field measurement, revolution counters, proximity detecting, and position measurement.

An uniaxial linear magnetic field will generate a linear output within the specified magnetic field range.

FEATURES

- ✦ Output proportional to magnetic field strength with very high sensitivity
- ✦ Very small hysteresis
- ✦ Large operating temperature range, from -40°C up to +150 °C
- ✦ Highly reliable
- ✦ With / without internal magnet

APPLICATIONS

- ✦ Detection of very weak magnetic fields, like earth magnetic field, or field generated by small magnetic particles
- ✦ Detection of objects that distort non-local magnetic fields
- ✦ Revolution measurement on ferromagnetic gears
- ✦ Contactless switch
- ✦ Contactless displacement / position sensor

DESCRIPTION

An uniaxial linear magnetic field (in y-direction) will generate a linear output within the specified magnetic field range. The sensor is available in two types: the **KMY 20 M**, **KMY 21 M** and **KMZ 20 M** sensor types contain intrinsic magnets which provide an auxiliary magnetic field (in x-direction) at the sensor die which prevents magnetic domains from flipping irregularly.

If the dies **MR174B** or the components **KMY22**, **KMY20S** or **KMZ20S** are used, the auxiliary field has to be provided by the user. The dependence of the sensitivity with auxiliary field strength is depicted in the figure aside.

Figure 1: Sensitivity dependence on auxiliary field strength

Auxiliary Field Dependence

Auxiliary field strengths below $H_x < 1.5$ kA/m are not recommended, as small disturbances may flip the magnetization domains. Sometimes, the magnetic conditions in the application may provide enough H_x bias field stabilization. MEAS Germany can provide advice for customer specific magnet arrangements.

If a bias field H_x is not applied or H_x is less than 2.5 kA/m, the sensor may be used only in a limited field range H_y , depending on the present total bias field $H_{x,tot}$. In this case, it is strongly recommended to 'premagnetize' the sensor, i.e. align all magnetic domains consistently, prior to the measurement.

$H_{x,tot}$ is the sum of all acting magnetic fields in x direction at the sensor die.

Do not use the sensor outside the safe operating area. Leaving the safe operating area can destroy an existing premagnetization and therefore will lead to unreproducible sensor signals.

SENSOR MODELS

KMY 20 / KMY 22 / KMZ 20

The KMY and KMZ sensors are highly sensitive magnetic field sensors which utilize the anisotropic magneto resistance effect. The KMY 20 and KMZ 20 sensors contain a Wheatstone bridge.

Figure 4: Characteristic output curve of KMY 20 S / KMY 22 / KMZ 20 S for an auxiliary field strength of $H_x=3$ kA/m

KMY 21

In contrast to the KMY20 sensor products, the **KMY 21 M** consists of a half bridge, making the sensor well suited for dynamic measurements.

It contains an internal magnet, which provides an auxiliary field of approx. 2.5 kA/m.
