Switching Sensor

SPECIFICATIONS

- ◆ Temperature Compensated Switching Point
- ◆ Low Power Consumption

The MS32 is a magnetic field sensor which is built in the form of a Wheatstone bridge. Each of its four resistors is made from *Permalloy*, a material that shows the *anisotropic magneto resistance effect*. An unidirectional magnetic field in the surface parallel to the chip (x-y plane) along the y-axis will deliver a field dependent output signal. A **magnetic switching point**, which is almost **independent on temperature** is typically set to $H_s=1.85$ kA/m. In addition, the characteristic curve is linear over a wide magnetic field range. Thus, the new MS32 simplifies the adaption of the sensor to different mechanical and magnetical environments. The sensor die is packaged in a TDFN package.

All parameters are measured on wafer level.

1) average gradient in the range 1.0 - 2.0 kA/m

2) difference between output voltage/supply voltage measured at H = 7 kA/m and H = 0 kA/m

3) hysteresis [in kA/m] = hysteresis [in mV/V] / S

4) switching voltage = 0 mV/V

5) switching field = magnetic field at switching voltage

6) values at -25°C can be determined by linear extrapolation from +30°C- and +85°C-values.

7) recommended solder reflow process according to IPC/JEDEC J-STD-020D (Pb-Free Process)
