

Fast-Charge IC

Features

- ▶ Fast charge and conditioning of nickel cadmium or nickel-metal hydride batteries
- ▶ Hysteretic PWM switch-mode current regulation or gated control of an external regulator
- ▶ Easily integrated into systems or used as a stand-alone charger
- ▶ Pre-charge qualification of temperature and voltage
- ▶ Configurable, direct LED outputs display battery and charge status
- ▶ Fast-charge termination by Δ temperature/ Δ time, peak voltage detection, $-\Delta V$, maximum voltage, maximum temperature, and maximum time
- ▶ Optional top-off charge and pulsed current maintenance charging
- ▶ Logic-level controlled low-power mode ($< 5\mu A$ standby current)

General Description

The bq2004 Fast Charge IC provides comprehensive fast charge control functions together with high-speed switching power control circuitry on a monolithic CMOS device.

Integration of closed-loop current control circuitry allows the bq2004 to be the basis of a cost-effective solution for stand-alone and system-integrated chargers for batteries of one or more cells.

Switch-activated discharge-before-charge allows bq2004-based chargers to support battery conditioning and capacity determination.

High-efficiency power conversion is accomplished using the bq2004 as a hysteretic PWM controller for switch-mode regulation of the charging current. The bq2004 may alternatively be used to gate an externally regulated charging current.

Fast charge may begin on application of the charging supply, replace-

ment of the battery, or switch depression. For safety, fast charge is inhibited unless/until the battery temperature and voltage are within configured limits.

Temperature, voltage, and time are monitored throughout fast charge. Fast charge is terminated by any of the following:

- Rate of temperature time ($\Delta T/\Delta t$)
- Peak voltage detection (PVD)
- Negative delta voltage ($-\Delta V$)
- Maximum voltage
- Maximum temperature
- Maximum time

After fast charge, optional top-off and pulsed current maintenance phases are available.

Pin Connections

Pin Names

DCMD	Discharge command	SNS	Sense resistor input
DSEL	Display select	LED ₁	Charge status output 1
VSEL	Voltage termination select	LED ₂	Charge status output 2
TM ₁	Timer mode select 1	V _{SS}	System ground
TM ₂	Timer mode select 2	V _{CC}	5.0V \pm 10% power
TCO	Temperature cutoff	MOD	Charge current control
TS	Temperature sense	DIS	Discharge control output
BAT	Battery voltage	$\overline{\text{INH}}$	Charge inhibit input

bq2004

Pin Descriptions

$\overline{\text{DCMD}}$ Discharge-before-charge control input

The $\overline{\text{DCMD}}$ input controls the conditions that enable discharge-before-charge. $\overline{\text{DCMD}}$ is pulled up internally. A negative-going pulse on $\overline{\text{DCMD}}$ initiates a discharge to end-of-discharge voltage (EDV) on the BAT pin, followed by a new charge cycle start. Tying $\overline{\text{DCMD}}$ to ground enables automatic discharge-before-charge on every new charge cycle start.

DSEL Display select input

This three-state input configures the charge status display mode of the LED₁ and LED₂ outputs. See Table 2.

VSEL Voltage termination select input

This three-state input controls the voltage-termination technique used by the bq2004. When high, PVD is active. When floating, $-\Delta V$ is used. When pulled low, both PVD and $-\Delta V$ are disabled.

TM₁-TM₂ Timer mode inputs

TM₁ and TM₂ are three-state inputs that configure the fast charge safety timer, voltage termination hold-off time, "top-off", and trickle charge control. See Table 1.

TCO Temperature cut-off threshold input

Input to set maximum allowable battery temperature. If the potential between TS and SNS is less than the voltage at the TCO input, then fast charge or top-off charge is terminated.

TS Temperature sense input

Input, referenced to SNS, for an external thermister monitoring battery temperature.

BAT Battery voltage input

BAT is the battery voltage sense input, referenced to SNS. This is created by a high-impedance resistor-divider network connected between the positive and the negative terminals of the battery.

SNS Charging current sense input

SNS controls the switching of MOD based on an external sense resistor in the current path of the battery. SNS is the reference potential for both the TS and BAT pins. If SNS is connected to V_{SS}, then MOD switches high at the beginning of charge and low at the end of charge.

LED₁-LED₂ Charge status outputs

Push-pull outputs indicating charging status. See Table 2.

V_{SS} Ground

V_{CC} V_{CC} supply input

5.0V, $\pm 10\%$ power input.

MOD Charge current control output

MOD is a push-pull output that is used to control the charging current to the battery. MOD switches high to enable charging current to flow and low to inhibit charging current flow.

DIS Discharge control output

Push-pull output used to control an external transistor to discharge the battery before charging.

$\overline{\text{INH}}$ Charge inhibit input

When low, the bq2004 suspends all charge actions, drives all outputs to high impedance, and assumes a low-power operational state. When transitioning from low to high, a new charge cycle is started.

Functional Description

Figure 3 shows a block diagram and Figure 4 shows a state diagram of the bq2004.

Battery Voltage and Temperature Measurements

Battery voltage and temperature are monitored for maximum allowable values. The voltage presented on the battery sense input, BAT, should represent a two-cell potential for the battery under charge. A resistor-divider ratio of:

$$\frac{RB1}{RB2} = \frac{N}{2} - 1$$

is recommended to maintain the battery voltage within the valid range, where N is the number of cells, RB1 is the resistor connected to the positive battery terminal, and RB2 is the resistor connected to the negative battery terminal. See Figure 1.

Note: This resistor-divider network input impedance to end-to-end should be at least 200kΩ and less than 1MΩ.

A ground-referenced negative temperature coefficient thermistor placed in proximity to the battery may be used as a low-cost temperature-to-voltage transducer. The temperature sense voltage input at TS is developed using a resistor-thermistor network between VCC and VSS. See Figure 1. Both the BAT and TS inputs are referenced to SNS, so the signals used inside the IC are:

$$V_{BAT} - V_{SNS} = V_{CELL}$$

and

$$V_{TS} - V_{SNS} = V_{TEMP}$$

Discharge-Before-Charge

The \overline{DCMD} input is used to command discharge-before-charge via the DIS output. Once activated, DIS becomes active (high) until V_{CELL} falls below V_{EDV} , at which time DIS goes low and a new fast charge cycle begins.

The \overline{DCMD} input is internally pulled up to V_{CC} (its inactive state). Leaving the input unconnected, therefore, results in disabling discharge-before-charge. A negative going pulse on \overline{DCMD} initiates discharge-before-charge at any time regardless of the current state of the bq2004. If \overline{DCMD} is tied to V_{SS} , discharge-before-charge will be the first step in all newly started charge cycles.

Starting a Charge Cycle

A new charge cycle (see Figure 2) is started by:

1. V_{CC} rising above 4.5V
2. V_{CELL} falling through the maximum cell voltage, V_{MCV} where:

$$V_{MCV} = 0.8 * V_{CC} \pm 30mV$$

3. A transition on the \overline{INH} input from low to high.

If \overline{DCMD} is tied low, a discharge-before-charge is executed as the first step of the new charge cycle. Otherwise, pre-charge qualification testing is the first step.

The battery must be within the configured temperature and voltage limits before fast charging begins.

The valid battery voltage range is $V_{EDV} < V_{BAT} < V_{MCV}$ where:

$$V_{EDV} = 0.4 * V_{CC} \pm 30mV$$

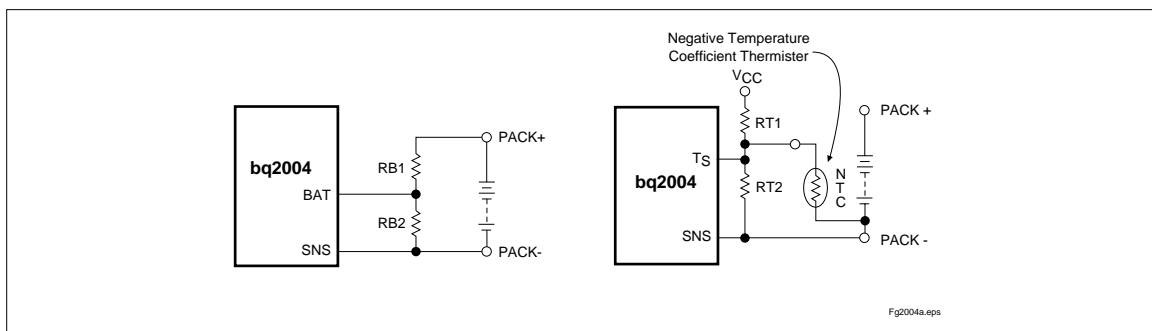

Figure 1. Voltage and Temperature Monitoring

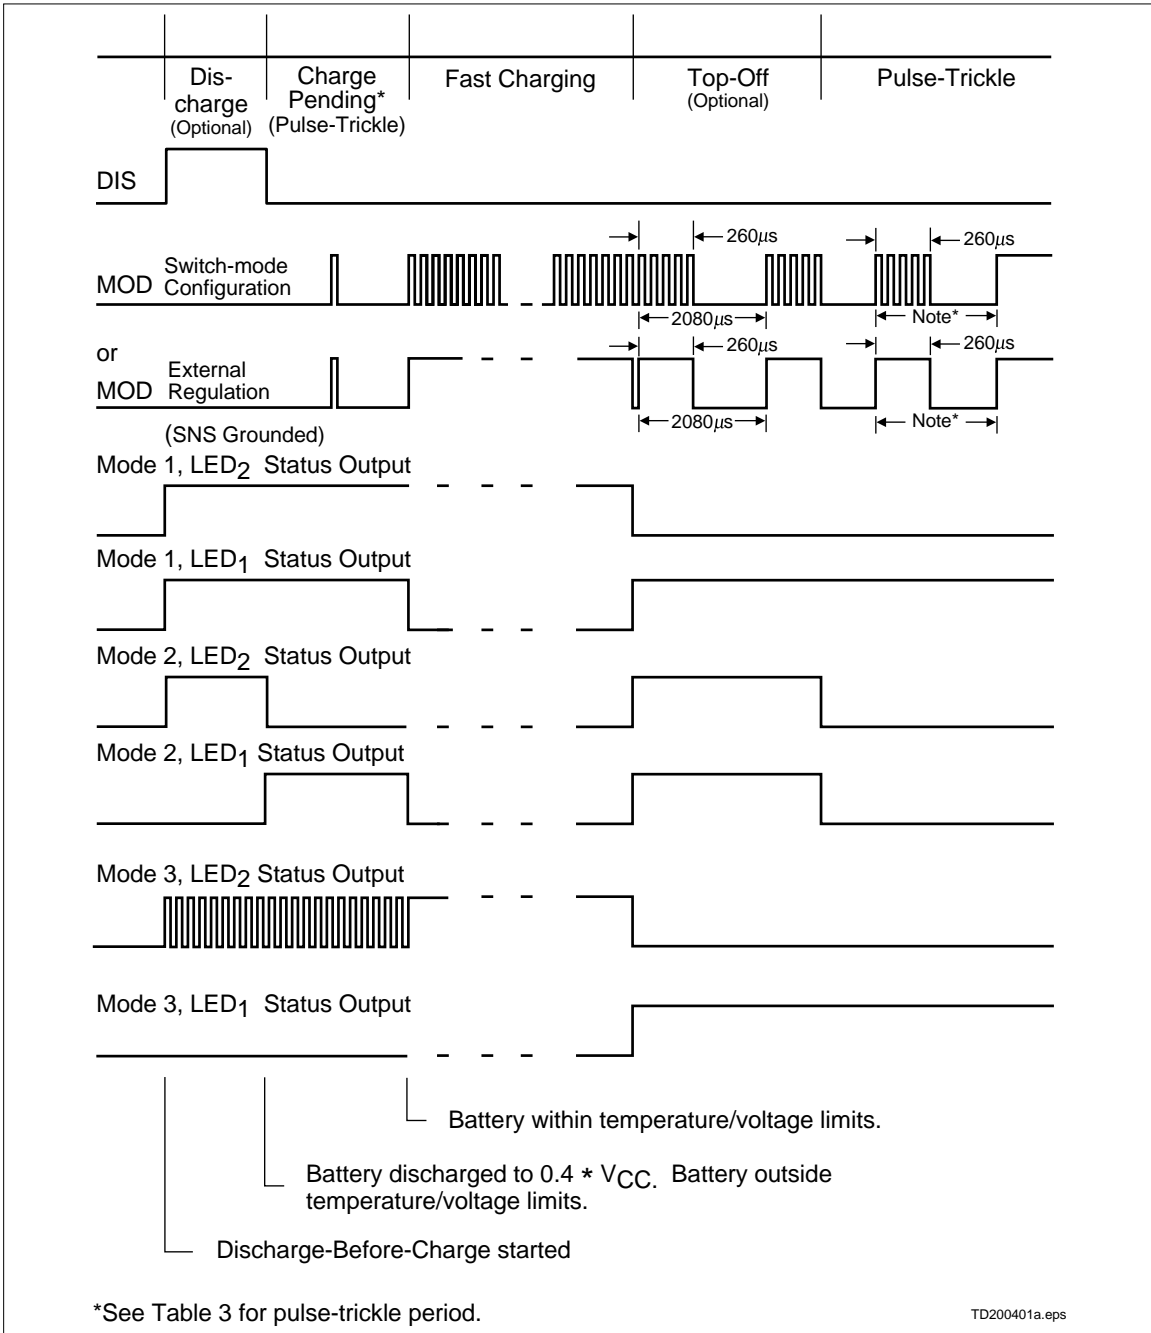

Figure 2. Charge Cycle Phases

The valid temperature range is $V_{HTF} < V_{TEMP} < V_{LTF}$, where:

$$V_{LTF} = 0.4 * V_{CC} \pm 30mV$$

$$V_{HTF} = [(1/4 * V_{LTF}) + (3/4 * V_{TCO})] \pm 30mV$$

Note: The low temperature fault (LTF) threshold is not enforced if the IC is configured for PVD termination (VSEL = high).

V_{TCO} is the voltage presented at the TCO input pin, and is configured by the user with a resistor divider between V_{CC} and ground. The allowed range is 0.2 to $0.4 * V_{CC}$.

If the temperature of the battery is out of range, or the voltage is too low, the chip enters the charge pending state and waits for both conditions to fall within their allowed limits. The MOD output is modulated to provide the configured trickle charge rate in the charge pending state. There is no time limit on the charge pending state; the charger remains in this state as long as the voltage or temperature conditions are outside of the allowed limits. If the voltage is too high, the chip goes to the battery absent state and waits until a new charge cycle is started.

Fast charge continues until termination by one or more of the six possible termination conditions:

- Delta temperature/delta time ($\Delta T/\Delta t$)
- Peak voltage detection (PVD)
- Negative delta voltage ($-\Delta V$)
- Maximum voltage
- Maximum temperature
- Maximum time

PVD and -V Termination

The bq2004 samples the voltage at the BAT pin once every 34s. When $-\Delta V$ termination is selected, if V_{CELL} is lower than any previously measured value by $12mV \pm 4mV$ ($6mV/cell$), fast charge is terminated. When PVD termination is selected, if V_{CELL} is lower than any previ-

VSEL Input	Voltage Termination
Low	Disabled
Float	$-\Delta V$
High	PVD

ously measured value by $6mV \pm 2mV$ ($3mV/cell$), fast charge is terminated. The PVD and $-\Delta V$ tests are valid in the range $0.4 * V_{CC} < V_{CELL} < 0.8 * V_{CC}$.

Voltage Sampling

Each sample is an average of voltage measurements taken $57\mu s$ apart. The IC takes 32 measurements in PVD mode and 16 measurements in $-\Delta V$ mode. The resulting sample periods ($9.17ms$ and $18.18ms$, respectively) filter out harmonics centered around $55Hz$ and $109Hz$. This technique minimizes the effect of any AC line ripple that may feed through the power supply from either $50Hz$ or $60Hz$ AC sources. Tolerance on all timing is $\pm 16\%$.

Voltage Termination Hold-off

A hold-off period occurs at the start of fast charging. During the hold-off period, $-\Delta V$ termination is disabled. This avoids premature termination on the voltage spikes sometimes produced by older batteries when fast-charge current is first applied. $\Delta T/\Delta t$, maximum voltage and maximum temperature terminations are not affected by the hold-off period.

T/ t Termination

The bq2004 samples at the voltage at the TS pin every 34s, and compares it to the value measured two samples earlier. If V_{TEMP} has fallen $16mV \pm 4mV$ or more, fast charge is terminated. If VSEL = high, the $\Delta T/\Delta t$ termination test is valid only when $V_{TCO} < V_{TEMP} < V_{TCO} + 0.2 * V_{CC}$. Otherwise the $\Delta T/\Delta t$ termination test is valid only when $V_{TCO} < V_{TEMP} < V_{LTF}$.

Temperature Sampling

Each sample is an average of 16 voltage measurements taken $57\mu s$ apart. The resulting sample period ($18.18ms$) filters out harmonics around $55Hz$. This technique minimizes the effect of any AC line ripple that may feed through the power supply from either $50Hz$ or $60Hz$ AC sources. Tolerance on all timing is $\pm 16\%$.

Maximum Voltage, Temperature, and Time

Anytime V_{CELL} rises above V_{MCV} , the LEDs go off and charging ceases immediately. If V_{CELL} then falls back below V_{MCV} before $t_{MCV} = 1.5s \pm 0.5s$, the chip transitions to the Charge Complete state (maximum voltage termination). If V_{CELL} remains above V_{MCV} at the expiration of t_{MCV} , the bq2004 transitions to the Battery Absent state (battery removal). See Figure 4.

Maximum temperature termination occurs anytime V_{TEMP} falls below the temperature cutoff threshold V_{TCO} . Unless PVD termination is enabled (VSEL = high), charge will also be terminated if V_{TEMP} rises above the low temperature fault threshold, V_{LTF} , after fast charge begins. The V_{LTF} threshold is not enforced when the IC is configured for PVD termination.

Maximum charge time is configured using the TM pin. Time settings are available for corresponding charge rates of $C/4$, $C/2$, $1C$, and $2C$. Maximum time-out termination is enforced on the fast-charge phase, then reset,

bq2004

and enforced again on the top-off phase, if selected. There is no time limit on the trickle-charge phase.

Top-off Charge

An optional top-off charge phase may be selected to follow fast charge termination for the C/2 through 4C rates. This phase may be necessary on NiMH or other battery chemistries that have a tendency to terminate charge prior to reaching full capacity. With top-off enabled, charging continues at a reduced rate after fast-charge termination for a period of time equal to the fast-charge safety time (See Table 1.) During top-off, the MOD pin is enabled at a duty cycle of 260µs active for every 1820µs inactive. This modulation results in an average rate 1/8th that of the fast charge rate. Maximum voltage, time, and temperature are the only termination methods enabled during top-off.

Pulse-Trickle Charge

Pulse-trickle charging follows the fast charge and optional top-off charge phases to compensate for self-discharge of the battery while it is idle in the charger. The configured pulse-trickle rate is also applied in the charge pending state to raise the voltage of an over-discharged battery up to the minimum required before fast charge can begin.

In the pulse-trickle mode, MOD is active for 260µs of a period specified by the settings of TM1 and TM2. See Table 1. The resulting trickle-charge rate is C/64 when

top-off is enabled and C/32 when top-off is disabled. Both pulse trickle and top-off may be disabled by tying TM1 and TM2 to V_{SS}.

Charge Status Indication

Charge status is indicated by the LED₁ and LED₂ outputs. The state of these outputs in the various charge cycle phases is given in Table 2 and illustrated in Figure 2.

In all cases, if V_{CELL} exceeds the voltage at the MCV pin, both LED₁ and LED₂ outputs are held low regardless of other conditions. Both can be used to directly drive an LED.

Charge Current Control

The bq2004 controls charge current through the MOD output pin. The current control circuitry is designed to support implementation of a constant-current switching regulator or to gate an externally regulated current source.

When used in switch mode configuration, the nominal regulated current is:

$$I_{REG} = 0.225V/R_{SNS}$$

Charge current is monitored at the SNS input by the voltage drop across a sense resistor, R_{SNS}, between the low side of the battery pack and ground. R_{SNS} is sized to provide the desired fast charge current.

Table 1. Fast-Charge Safety Time/Hold-Off/Top-Off Table

Corresponding Fast-Charge Rate	TM1	TM2	Typical Fast-Charge Safety Time (minutes)	Typical PVD, $\pm\Delta V$ Hold-Off Time (seconds)	Top-Off Rate	Pulse-Trickle Rate	Pulse-Trickle Period (Hz)
C/4	Low	Low	360	137	Disabled	Disabled	Disabled
C/2	Float	Low	180	820	Disabled	C/32	240
1C	High	Low	90	410	Disabled	C/32	120
2C	Low	Float	45	200	Disabled	C/32	60
4C	Float	Float	23	100	Disabled	C/32	30
C/2	High	Float	180	820	C/16	C/64	120
1C	Low	High	90	410	C/8	C/64	60
2C	Float	High	45	200	C/4	C/64	30
4C	High	High	23	100	C/2	C/64	15

Note: Typical conditions = 25°C, V_{CC} = 5.0V.

If the voltage at the SNS pin is less than V_{SNSLO} , the MOD output is switched high to pass charge current to the battery.

$$V_{SNSLO} = 0.04 * V_{CC} \pm 25mV$$

$$V_{SNSHI} = 0.05 * V_{CC} \pm 25mV$$

When the SNS voltage is greater than V_{SNSHI} , the MOD output is switched low—shutting off charging current to the battery.

When used to gate an externally regulated current source, the SNS pin is connected to V_{SS} , and no sense resistor is required.

Table 2. bq2004 LED Status Display Options

Mode 1	Charge Status	LED ₁	LED ₂
DSEL = V_{SS}	Battery absent	Low	Low
	Fast charge pending or discharge-before-charge in progress	High	High
	Fast charge in progress	Low	High
	Charge complete, top-off, and/or trickle	High	Low
Mode 2	Charge Status	LED ₁	LED ₂
DSEL = Floating	Battery absent, fast charge in progress or complete	Low	Low

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) Multiple Top-Side Markings will be inside parentheses. Only one Top-Side Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Top-Side Marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

REEL DIMENSIONS

TAPE DIMENSIONS

A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

TAPE AND REEL INFORMATION

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
BQ2004SNTR	SOIC	D	16	2500	330.0	16.4	6.5	10.3	2.1	8.0	16.0	Q1

TAPE AND REEL BOX DIMENSIONS

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Length (mm)	Width (mm)	Height (mm)
BQ2004SNTR	SOIC	D	16	2500	367.0	367.0	38.0

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in inches (millimeters).
 - B. This drawing is subject to change without notice.
 - C. Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.006 (0,15) each side.
 - D. Body width does not include interlead flash. Interlead flash shall not exceed 0.017 (0,43) each side.
 - E. Reference JEDEC MS-012 variation AC.

D (R-PDSO-G16)

PLASTIC SMALL OUTLINE

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Publication IPC-7351 is recommended for alternate designs.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
 - Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
