DESCRIPTION

The 74LVT74 is a dual positive edge-triggered D-type flip-flop featuring individual data, clock, set, and reset inputs; also true and complementary outputs. Set (\$\overline{S}D\$) and reset (\$\overline{R}D\$) are asynchronous active low inputs and operate independently of the clock input. When set and reset are inactive (high), data at the D input is transferred to the Q and \$\overline{Q}\$ outputs on the low-to-high transition of the clock. Data must be stable just one setup time prior to the low-to-high transition of the clock for predictable operation. Clock triggering occurs at a voltage level and is not directly related to the transition time of the positive-going pulse. Following the hold time interval, data at the D input may be changed without affecting the levels of the output.

PIN DESCRIPTION

PIN NUMBER	SYMBOL	NAME AND FUNCTION
2, 12	D0, D1	Data inputs
3, 11	CP0, CP1	Clock inputs (active rising edge)
4, 10	SD0, SD1	Set inputs (active LOW)
1, 13	RD0, RD1	Reset inputs (active LOW)
5, 6, 8, 9	Qn, Qn	Data outputs

NOTES:

H = High voltage level

High voltage level one setup time prior to low-to-high clock transition

Low voltage level

Low voltage level one setup time prior to low-to-high clock transition

No change from the previous setup

Don't care

Low-to-high clock transition

 Not low-to-high clock transition
 This setup is unstable and will change when either set or reset return to the high level.

ABSOLUTE MAXIMUM RATINGS^{1, 2}

SYMBOL	PARAMETER	CONDITIONS	RATING	UNIT	
V _{CC}	DC supply voltage		-0.5 to +4.6	V	
I _{IK}	DC input diode current	V _I < 0	-50	mA	
VI	DC input voltage ³		-0.5 to +7.0	V	
I _{OK}	DC output diode current	V _O < 0	-50	mA	
V _{OUT}	DC output voltage ³	Output in Off or High state	-0.5 to +7.0	V	
lau-	DC output current	Output in High state	-32	mA	
OUT	Do output current	Output in Low state	64	IIIA	
T _{stg}	Storage temperature range		-65 to 150	°C	

- 1. Stresses beyond those listed may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- 2. The performance capability of a high-performance integrated circuit in conjunction with its thermal environment can create junction temperatures which are detrimental to reliability. The maximum junction temperature of this integrated circuit should not exceed 150°C.
- 3. The input and output negative voltage ratings may be exceeded if the input and output clamp current ratings are observed.
