74ALVC16374

Low-Voltage 1.8/2.5/3.3 V 16-Bit D-Type Flip-Flop

With 3.6 V−Tolerant Inputs and Outputs (3−State, Non−Inverting)

The 74ALVC16374 is an advanced performance, non−inverting 16−bit D−type flip−flop. It is designed for very high−speed, very low−power operation in 1.8 V, 2.5 V or 3.3 V systems. The ALVC16374 is byte controlled, with each byte functioning identically, but independently. Each byte has separate Output Enable and Clock Pulse inputs. These control pins can be tied together for a full 16−bit operation.

The 74ALVC16374 consists of 16 edge−triggered flip−flops with individual D−type inputs and 3.6 V−tolerant 3−state outputs. The clocks (CPn) and Output Enables ($\overline{OEn}$) are common to all flip−flops within the respective byte. The flip−flops will store the state of individual D inputs that meet the setup and hold time requirements on the LOW−to−HIGH Clock (CP) transition. With the $\overline{OE}$ LOW, the contents of the flip−flops are available at the outputs. When the $\overline{OE}$ is HIGH, the outputs go to the high impedance state. The $\overline{OE}$ input level does not affect the operation of the flip−flops.

- Designed for Low Voltage Operation: V_{CC} = 1.65−3.6 V
- 3.6 V Tolerant Inputs and Outputs
- High Speed Operation: 3.6 ns max for 3.0 to 3.6 V
  4.5 ns max for 2.3 to 2.7 V
  7.8 ns max for 1.65 to 1.95 V
- Static Drive: ±24 mA Drive at 3.0 V
  ±12 mA Drive at 2.3 V
  ±4 mA Drive at 1.65 V
- Supports Live Insertion and Withdrawal
- I_{OFF} Specification Guarantees High Impedance When V_{CC} = 0 V†
- Near Zero Static Supply Current in All Three Logic States (40 μA) Substantially Reduces System Power Requirements
- Latchup Performance Exceeds ±250 mA @ 125°C
- ESD Performance: Human Body Model >2000 V; Machine Model >200 V
- Second Source to Industry Standard 74ALVC16374

†To ensure the outputs activate in the 3−state condition, the output enable pins should be connected to V_{CC} through a pull−up resistor. The value of the resistor is determined by the current sinking capability of the output connected to the $\overline{OE}$ pin.
