Low Voltage Comparators

The NCS2200 Series is an industry first sub-one volt, low power comparator family. These devices consume only 10 μ A of supply current. They are guaranteed to operate at a low voltage of 0.85 V which allows them to be used in systems that require less than 1.0 V and are fully operational up to 6.0 V which makes them convenient for use in both 3.0 V and 5.0 V systems. Additional features include no output phase inversion with overdriven inputs, internal hysteresis, which allows for clean output switching, and rail-to-rail input and output performance. The NCS2200 Series is available in the tiny SOT23–5 and SOT23–6 package. There are eight options featuring two industry standard pinouts. Additionally, the NCS2200 device is available in the tiny QFN 2x2.2 package. (Table 1)

The NCS2201/3 Series in the SOT23–6 package features an enable function, which can be externally controlled. When the enable pin is pulled low (output tri–state mode), current consumption is typically 0.3 μ A. This allows the user to implement these devices in power sensitive applications such as portable electronics.

OPERATING DESCRIPTION

The NCS2200 Series is an industry first sub-one volt, low power comparator family. This series is designed for rail-to-rail input and output performance. These devices consume only 10 μ A of supply current while achieving a typical propagation delay of 1.1 μ s at a 20 mV input overdrive. Figures 10 and 11 show propagation delay with various input overdrives. This comparator family is guaranteed to operate at a low voltage of 0.85 V up to 6.0 V. This is accomplished by the use of a modified analog CMOS process that implements depletion MOSFET devices. The common-mode input voltage range extends 0.1 V beyond the upper and lower rail without phase inversion or other adverse effects. This series is available in the SOT23–5 and SOT23–6 package. Additionally, the NCS2200 device is available in the tiny QFN 2x2.2 package.

The SOT23–6 features the enable function, which can be externally controlled. This feature allows significantly lower current consumption of 0.3 μ A. This makes the devices suitable for implementation in power sensitive applications such as portable electronics. The enable function is active high when connected to the V_{CC} pin.

IN (+) Output IN (-) Output

Figure 17. NCS2200/1SNxT1 Complementary Output Configuration

When the enable pin is driven low (device disabled), output tri-state mode is activated. The device will remain in this mode and will not respond to any changes at the inputs of the comparator. In order to pull the device out of tri-state mode, the enable upper voltage threshold must be met. Figure 15 shows the enable input voltage required to either enable or disable the device, with a variance in supply voltage. In addition, these devices have a typical internal hysteresis of ± 8.0 mV. This allows for greater noise immunity and clean output switching.

Output Stage

The NCS2200/1 has a complementary P and N channel output stage that has capability of driving a rail-to-rail output swing with a load ranging up to 5.0 mA. It is designed such that shoot-through current is minimized while switching. This feature eliminates the need for bypass capacitors under most circumstances.

The NCS2202/3 has an open drain N-channel output stage that can be pulled up to 6.0 V (max) with an external resistor. This facilitates mixed voltage system applications.

Figure 18. NCS2202/3SNxT1 Open Drain Output Configuration

The oscillation frequency can be programmed as follows:

$$f = \frac{1}{T} = \frac{1}{2.2 R_X C_X}$$

Figure 19. Schmitt Trigger Oscillator

The resistor divider R_1 and R_2 can be used to set the magnitude of the input pulse. The pulse width is set by adjusting C_1 and R_3 .

Figure 20. One-Shot Multivibrator

This circuit converts 5 V logic to 3 V logic. Using the NCS2202/3 allows for full 5 V logic swing without creating overvoltage on the 3 V logic input.

MINIMUM RECOMMENDED FOOTPRINT FOR SURFACE MOUNTED APPLICATIONS

Surface mount board layout is a critical portion of the total design. The footprint for the semiconductor packages must be the correct size to insure proper solder connection

interface between the board and the package. With the correct pad geometry, the packages will self align when subjected to a solder reflow process.
