Product Description

The PCS1P2192A is a clock generator that generates multiple selectable pixel clock outputs for Video Display Panel applications from an external 20MHz reference clock. The PLL based clock generator is specifically designed to provide zero ppm frequency synthesis error on all clock outputs. Various pixel clock rates are selectable through frequency selection pins S[2:0] (Refer to *Frequency Selection Table*) The device provides a reference clock output additionally. Operating Supply Voltage for this device is $3.3V \pm 0.3V$. The device is available in an 8-pin SOIC package.

Application

PCS1P2192A is targeted towards Video Display Panel (VDP) applications like VGA, SVGA, XGA, WXGA, UXGA.

Use either pull-up or pull-down 0Ω Resistor with [S2:S0] for selection of CLKOUT frequencies.

PCB Layout Recommendation

For optimum device performance, following guidelines are recommended.

- Dedicated VDD and GND planes.
- The device must be isolated from system power supply noise. A 0.01μF decoupling capacitor should be mounted on the component side of the board as close to the VDD pin as possible. No vias should be

used between the decoupling capacitor and VDD pin. The PCB trace to VDD pin and the ground via should be kept as short as possible. All the VDD pins should have decoupling capacitors.

- In an optimum layout all components are on the same side of the board, minimizing vias through other signal layers.

A typical layout is shown in the figure below.
