## Product Description

PCS3P73U00A is a versatile, 3.3V / 2.5V Peak EMI reduction IC. PCS3P73U00A accepts an input clock either from a Crystal or from an external reference (AC or DC

coupled to XIN / CLKIN) and locks on to it delivering a 1x modulated clock output. PCS3P73U00A has a Frequency Selection (FS) control that facilitates selecting one of the two frequency ranges within the operating frequency range. Refer to the *Frequency Selection Table* for details.

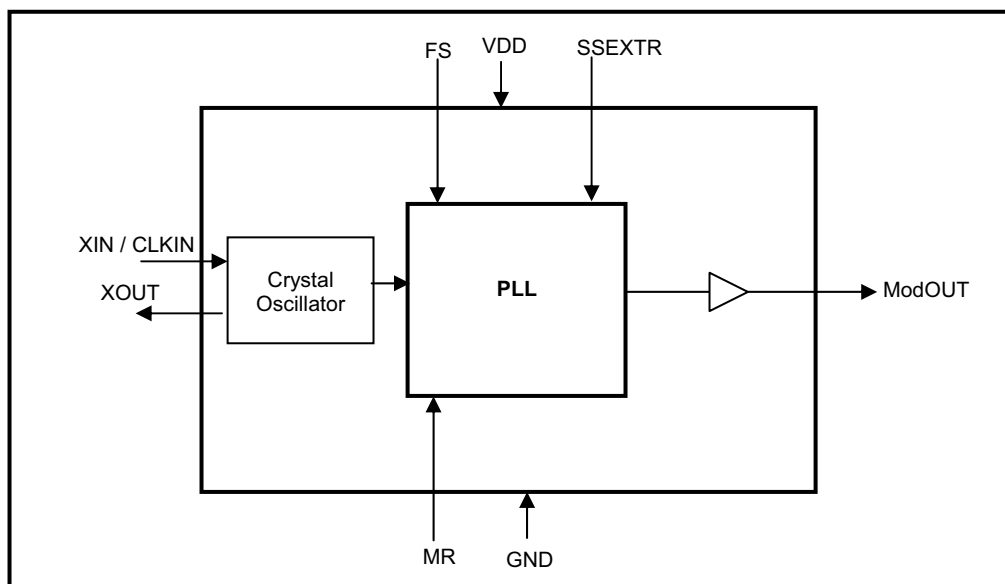

PCS3P73U00A has an SSEXTR pin to select different deviations depending upon the value of an external resistor connected between SSEXTR and GND. Modulation Rate (MR) control selects two different Modulation Rates.

PCS3P73U00A operates from a 3.3V / 2.5V supply and is available in an 8-pin TSSOP, SOIC, and TDFN (2mmX2mm) packages, over commercial temperature range.

## Application

PCS3P73U00A is targeted for USB applications. Refer to *SSEXTR Resistance Table for USB2.0 Compliance* for commonly used frequencies.

#### **R<sub>Compliance</sub>**

The value of the compliance resistor,  $R_{\text{Compliance}}$  sets the USB2.0 signaling rate (frequency) deviation to 1000ppm peak-to-peak (+/-500ppm). It causes a -4dB peak power EMI reduction at the 480MHz fundamental USB2.0 frequency. Higher harmonics are reduced more.

If the  $R_{\text{Compliance}}$  is set to a lower value than its compliance limit, it will set the USB2.0 signaling rate (frequency) deviation to above 1000ppm peak-to-peak. For settings above 1000ppm the USB2.0 compliance pass/fail

becomes gradually intermittent. USB2.0 functionality is maintained upto 3000ppm peak-to-peak signaling rate (frequency) deviation. The EMI tradeoff in the system is attenuation/compliance. While fully functional (and compliant intermittent) the 2000ppm frequency deviation can provide -7dB of EMI attenuation at the 480MHz fundamental.
