

# HIGH SPEED 3.3V 2K X 8 DUAL-PORT STATIC RAM WITH INTERRUPTS

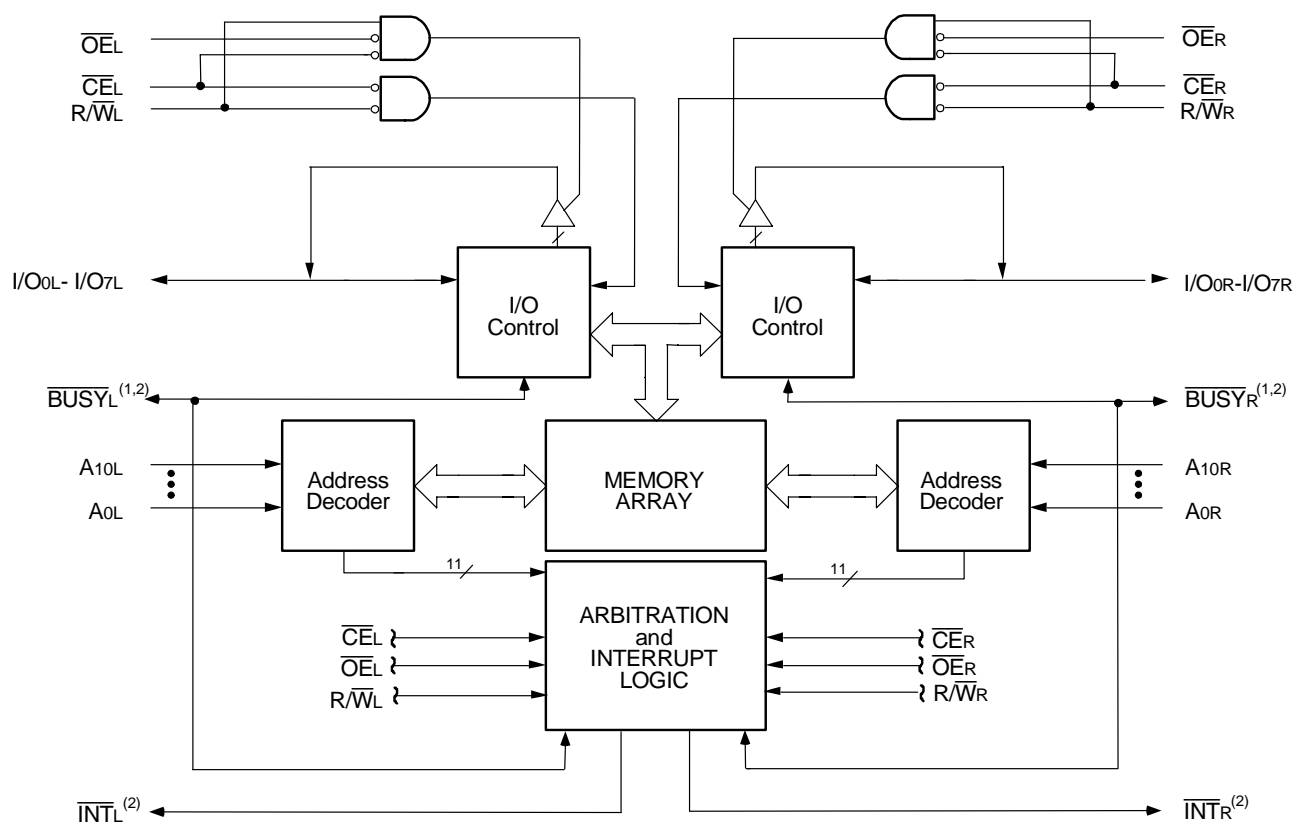

IDT71V321S/L

LEAD FINISH (SnPb) ARE IN EOL PROCESS - LAST TIME BUY EXPIRES JUNE 15, 2018

## Features

- ♦ **High-speed access**
  - Commercial & Industrial: 25/35/55ns (max.)
- ♦ **Low-power operation**
  - IDT71V321S  
Active: 325mW (typ.)  
Standby: 5mW (typ.)
  - IDT71V321L  
Active: 325mW (typ.)  
Standby: 1mW (typ.)
- ♦ **Two  $\overline{\text{INT}}$  flags for port-to-port communications**
- ♦ **On-chip port arbitration logic (IDT71V321 only)**
- ♦  **$\overline{\text{BUSY}}$  output flag**
- ♦ **Fully asynchronous operation from either port**
- ♦ **Battery backup operation—2V data retention (L only)**
- ♦ **TTL-compatible, single 3.3V power supply**
- ♦ **Available in 52-pin PLCC, 64-pin TQFP and STQFP packages**
- ♦ **Industrial temperature range (–40°C to +85°C) is available for selected speeds**
- ♦ **Green parts available, see ordering information**

## Description

The IDT71V321 is a high-speed 2K x 8 Dual-Port Static RAMs with internal interrupt logic for interprocessor communications. The IDT71V321 is designed to be used as a stand-alone 8-bit Dual-Port RAM.

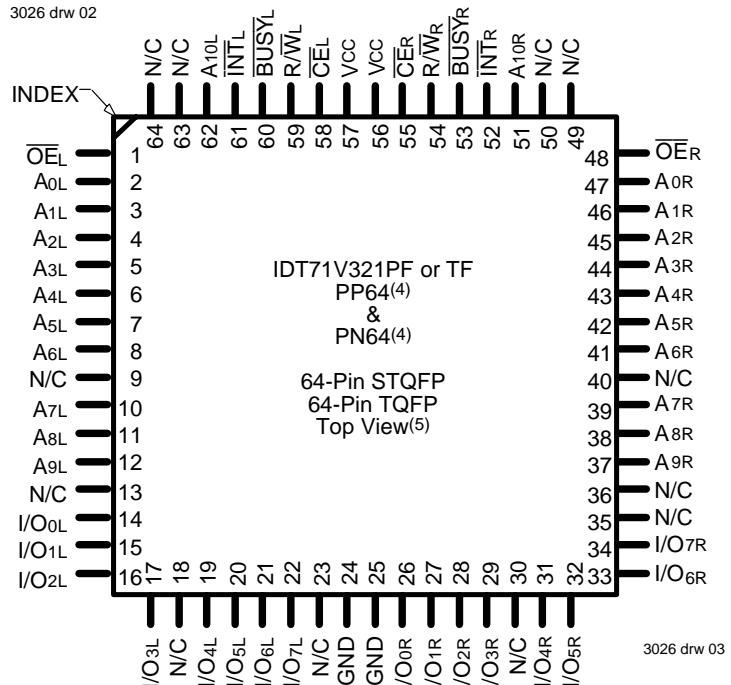

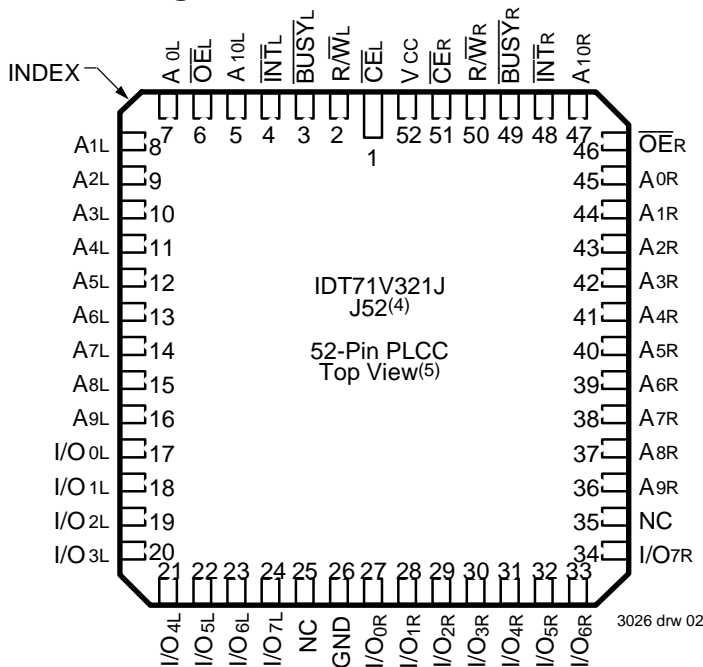

The device provides two independent ports with separate control, address, and I/O pins that permit independent, asynchronous access for reads or writes to any location in memory. An automatic power down feature, controlled by  $\overline{CE}$ , permits the on chip circuitry of each

port to enter a very low standby power mode.

Fabricated using CMOS high-performance technology, these devices typically operate on only 325mW of power. Low-power (L) versions offer battery backup data retention capability, with each Dual-Port typically consuming 200 $\mu$ W from a 2V battery.

The IDT71V321 devices are packaged in a 52-pin PLCC, a 64-pin TQFP (thin quad flatpack), and a 64-pin STQFP (super thin quad flatpack).

## Pin Configurations<sup>(1,2,3)</sup>

### NOTES:

1. All Vcc pins must be connected to power supply.
2. All GND pins must be connected to ground supply.
3. J52-1 package body is approximately .75 in x .75 in x .17 in.  
PP64-1 package body is approximately 10mm x 10mm x 1.4mm.  
PN64-1 package body is approximately 14mm x 14mm x 1.4mm.
4. This package code is used to reference the package diagram.
5. This text does not indicate orientation of the actual part-marking.

## Absolute Maximum Ratings<sup>(1)</sup>

Symbol	Rating	Commercial & Industrial	Unit
V <sub>TERM</sub> <sup>(2)</sup>	Terminal Voltage with Respect to GND	-0.5 to +4.6	V
T <sub>A</sub>	Operating Temperature	0 to +70	°C
T <sub>BIAS</sub>	Temperature Under Bias	-55 to +125	°C
T <sub>STG</sub>	Storage Temperature	-65 to +150	°C
I <sub>OUT</sub>	DC Output Current	50	mA

3026 tbl 01

### NOTES:

- Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of the specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- V<sub>TERM</sub> must not exceed V<sub>CC</sub> + 10% for more than 25% of the cycle time or 10ns maximum, and is limited to ≤ 20mA for the period of V<sub>TERM</sub> ≥ V<sub>CC</sub> + 10%.

## Capacitance<sup>(1)</sup>

(T<sub>A</sub> = +25°C, f = 1.0MHz) TQFP Only

Symbol	Parameter	Conditions <sup>(2)</sup>	Max.	Unit
C <sub>IN</sub>	Input Capacitance	V <sub>IN</sub> = 3dV	9	pF
C <sub>OUT</sub>	Output Capacitance	V <sub>OUT</sub> = 3dV	10	pF

3026 tbl 04

### NOTES:

- This parameter is determined by device characterization but is not production tested.
- 3dv references the interpolated capacitance when the input and output signals switch from 0V to 3V or from 3V to 0V.

## Recommended Operating Temperature and Supply Voltage<sup>(1,2)</sup>

Grade	Ambient Temperature	GND	V <sub>CC</sub>
Commercial	0°C to +70°C	0V	3.3V ± 0.3V
Industrial	-40°C to +85°C	0V	3.3V ± 0.3V

3026 tbl 02

### NOTES:

- This is the parameter T<sub>A</sub>. This is the "instant on" case temperature.
- Industrial temperature: for specific speeds, packages and powers contact your sales office.

## Recommended DC Operating Conditions

Symbol	Parameter	Min.	Typ.	Max.	Unit
V <sub>CC</sub>	Supply Voltage	3.0	3.3	3.6	V
GND	Ground	0	0	0	V
V <sub>IH</sub>	Input High Voltage	2.0	—	V <sub>CC</sub> +0.3 <sup>(2)</sup>	V
V <sub>IL</sub>	Input Low Voltage	-0.3 <sup>(1)</sup>	—	0.8	V

3026 tbl 03

### NOTES:

- V<sub>IL</sub> (min.) = -1.5V for pulse width less than 20ns.
- V<sub>TERM</sub> must not exceed V<sub>CC</sub> + 0.3V.

### NOTES:

1. Transition is measured 0mV from Low or High-impedance voltage with Output Test Load (Figure 2).
2. This parameter is guaranteed by device characterization, but is not production tested.
3. 'X' in part numbers indicates power rating (S or L).

## Timing Waveform of Read Cycle No. 1, Either Side<sup>(1)</sup>

### NOTES:

1.  $R/\bar{W} = V_{IH}$ ,  $\bar{CE} = V_{IL}$ , and is  $\bar{OE} = V_{IL}$ . Address is valid prior to the coincidental with  $\bar{CE}$  transition LOW.
2.  $t_{BDD}$  delay is required only in the case where the opposite port is completing a write operation to the same address location. For simultaneous read operations  $BUSY$  has no relationship to valid output data.
3. Start of valid data depends on which timing becomes effective last  $t_{AOE}$ ,  $t_{ACE}$ ,  $t_{AA}$ , and  $t_{BDD}$ .

## Timing Waveform of Read Cycle No. 2, Either Side<sup>(3)</sup>

### NOTES:

1. Timing depends on which signal is asserted last,  $\bar{OE}$  or  $\bar{CE}$ .
2. Timing depends on which signal is de-asserted first,  $\bar{OE}$  or  $\bar{CE}$ .
3.  $R/\bar{W} = V_{IH}$  and the address is valid prior to or coincidental with  $\bar{CE}$  transition LOW.
4. Start of valid data depends on which timing becomes effective last  $t_{AOE}$ ,  $t_{ACE}$ ,  $t_{AA}$ , and  $t_{BDD}$ .

### NOTES:

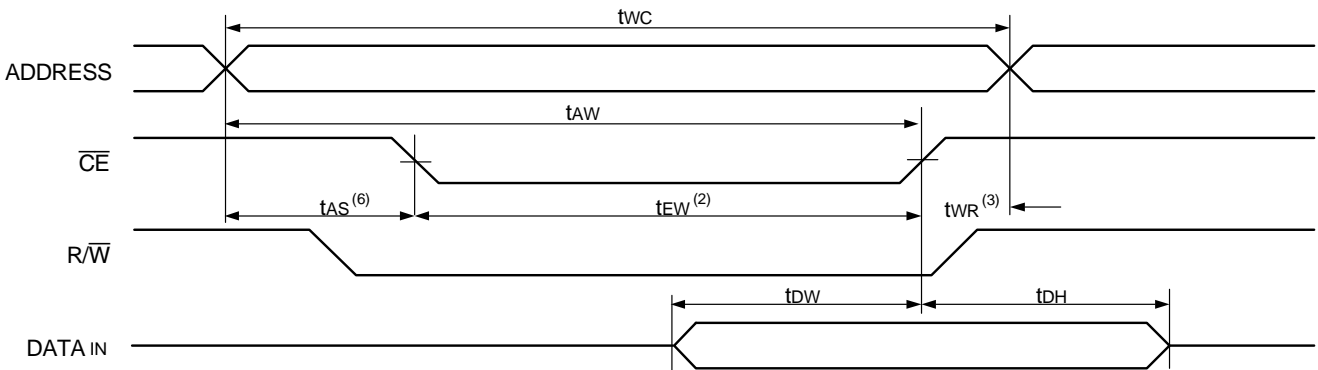

1. Transition is measured 0mV from Low or High-impedance voltage with Output Test Load (Figure 2).
2. This parameter is guaranteed by device characterization but is not production tested.
3. The specification for t<sub>dh</sub> must be met by the device supplying write data to the RAM under all operating conditions. Although t<sub>dh</sub> and t<sub>ow</sub> values will vary over voltage and temperature, the actual t<sub>dh</sub> will always be smaller than the actual t<sub>ow</sub>.
4. 'X' in part numbers indicates power rating (S or L).

## Timing Waveform of Write Cycle No. 1, ( $\overline{R/\overline{W}}$ Controlled Timing)<sup>(1,5,8)</sup>

3026 drw 08

## Timing Waveform of Write Cycle No. 2, ( $\overline{CE}$ Controlled Timing)<sup>(1,5)</sup>

3026 drw 09

### NOTES:

1.  $\overline{R/\overline{W}}$  or  $\overline{CE}$  must be HIGH during all address transitions.
2. A write occurs during the overlap ( $t_{EW}$  or  $t_{WP}$ ) of  $\overline{CE} = V_{IL}$  and  $\overline{R/\overline{W}} = V_{IL}$ .
3.  $t_{WR}$  is measured from the earlier of  $\overline{CE}$  or  $\overline{R/\overline{W}}$  going HIGH to the end of the write cycle.
4. During this period, the I/O pins are in the output state and input signals must not be applied.
5. If the  $\overline{CE}$  LOW transition occurs simultaneously with or after the  $\overline{R/\overline{W}}$  LOW transition, the outputs remain in the High-impedance state.
6. Timing depends on which enable signal ( $\overline{CE}$  or  $\overline{R/\overline{W}}$ ) is asserted last.
7. This parameter is determined to be device characterization, but is not production tested. Transition is measured 0mV from steady state with the Output Test Load (Figure 2).
8. If  $\overline{OE}$  is LOW during a  $\overline{R/\overline{W}}$  controlled write cycle, the write pulse width must be the larger of  $t_{WP}$  or ( $t_{WZ} + t_{OW}$ ) to allow the I/O drivers to turn off data to be placed on the bus for the required  $t_{OW}$ . If  $\overline{OE}$  is HIGH during a  $\overline{R/\overline{W}}$  controlled write cycle, this requirement does not apply and the write pulse can be as short as the specified  $t_{WP}$ .

**NOTES:**

1. Pins  $\overline{BUSY_L}$  and  $\overline{BUSY_R}$  are both outputs.  $\overline{BUSY}_x$  outputs on the IDT71V321 are totem-pole.
2. 'L' if the inputs to the opposite port were stable prior to the address and enable inputs of this port. 'H' if the inputs to the opposite port became stable after the address and enable inputs of this port. If  $t_{APS}$  is not met, either  $\overline{BUSY_L}$  or  $\overline{BUSY_R} = LOW$  will result.  $\overline{BUSY_L}$  and  $\overline{BUSY_R}$  outputs cannot be LOW simultaneously.
3. Writes to the left port are internally ignored when  $\overline{BUSY_L}$  outputs are driving LOW regardless of actual logic level on the pin. Writes to the right port are internally ignored when  $\overline{BUSY_R}$  outputs are driving LOW regardless of actual logic level on the pin.

## Functional Description

The IDT71V321 provides two ports with separate control, address and I/O pins that permit independent access for reads or writes to any location in memory. The IDT71V321 has an automatic power down feature controlled by  $\overline{CE}$ . The  $\overline{CE}$  controls on-chip power down circuitry that permits the respective port to go into a standby mode when not selected ( $\overline{CE} = V_{IH}$ ). When a port is enabled, access to the entire memory array is permitted.

## Interrupts

If the user chooses the interrupt function, a memory location (mail box or message center) is assigned to each port. The left port interrupt flag ( $\overline{INTL}$ ) is asserted when the right port writes to memory location 7FE (HEX), where a write is defined as the  $\overline{CE}_R = R/\overline{W}_R = V_{IL}$  per Truth Table II. The left port clears the interrupt by accessing address location 7FE when  $\overline{CE}_L = \overline{OE}_L = V_{IL}$ ,  $R/W$  is a "don't care". Likewise, the right port interrupt flag ( $\overline{INTR}$ ) is asserted when the left port writes to memory location 7FF (HEX) and to clear the interrupt flag ( $\overline{INTR}$ ), the right port must access the memory location 7FF. The message (8 bits) at 7FE or 7FF is user-defined, since it is an addressable SRAM location. If the interrupt function is not used, address locations 7FE and 7FF are not used as mail boxes, but as part of the random access memory. Refer to Truth Table II for the interrupt operation.

## Busy Logic

Busy Logic provides a hardware indication that both ports of the RAM have accessed the same location at the same time. It also allows one of the two accesses to proceed and signals the other side that the RAM is "Busy". The  $\overline{BUSY}$  pin can then be used to stall the access until the operation on the other side is completed. If a write operation has been attempted from the side that receives a busy indication, the write signal is gated internally to prevent the write from proceeding.

The use of  $\overline{BUSY}$  Logic is not required or desirable for all applications. In some cases it may be useful to logically OR the  $\overline{BUSY}$  outputs together and use any  $\overline{BUSY}$  indication as an interrupt source to flag the event of an illegal or illogical operation.

## Depth Expansion

The  $\overline{BUSY}$  arbitration, is based on the chip enable and address signals only. It ignores whether an access is a read or write.

The  $\overline{BUSY}$  outputs on the IDT71V321 are totem-pole type outputs and do not require pull-up resistors to operate. If these RAMs are being expanded in depth, then the  $\overline{BUSY}$  indication for the resulting array requires the use of an external AND gate
