## MC9S08PA60 Series Data Sheet

Supports: MC9S08PA60(A) and MC9S08PA32(A)

## Key features

- 8-Bit S08 central processor unit (CPU)
- Up to 20 MHz bus at 2.7 V to 5.5 V across temperature range of $-40^{\circ} \mathrm{C}$ to $105^{\circ} \mathrm{C}$
- Supporting up to 40 interrupt/reset sources
- Supporting up to four-level nested interrupt
- On-chip memory
- Up to 60 KB flash read/program/erase over full operating voltage and temperature
- Up to 256 byte EEPROM; 2-byte erase sector; program and erase while executing flash
- Up to 4096 byte random-access memory (RAM)
- Flash and RAM access protection
- Power-saving modes
- One low-power stop mode; reduced power wait mode
- Peripheral clock enable register can disable clocks to unused modules, reducing currents; allows clocks to remain enabled to specific peripherals in stop 3 mode
- Clocks
- Oscillator (XOSC) - loop-controlled Pierce oscillator; crystal or ceramic resonator range of 31.25 kHz to 39.0625 kHz or 4 MHz to 20 MHz
- Internal clock source (ICS) - containing a frequency-locked-loop (FLL) controlled by internal or external reference; precision trimming of internal reference allowing $1 \%$ deviation across temperature range of 0 ${ }^{\circ} \mathrm{C}$ to $70^{\circ} \mathrm{C}$ and $2 \%$ deviation across temperature range of $-40^{\circ} \mathrm{C}$ to $105^{\circ} \mathrm{C}$; up to 20 MHz
- System protection
- Watchdog with independent clock source
- Low-voltage detection with reset or interrupt; selectable trip points
- Illegal opcode detection with reset
- Illegal address detection with reset

## MC9S08PA60

## MC9S08PA60A and MC9S08PA32A are recommended for new design

- Development support
- Single-wire background debug interface
- Breakpoint capability to allow three breakpoints setting during in-circuit debugging
- On-chip in-circuit emulator (ICE) debug module containing two comparators and nine trigger modes
- Peripherals
- ACMP - one analog comparator with both positive and negative inputs; separately selectable interrupt on rising and falling comparator output; filtering
- ADC - 16-channel, 12-bit resolution; $2.5 \mu \mathrm{~s}$ conversion time; data buffers with optional watermark; automatic compare function; internal bandgap reference channel; operation in stop mode; optional hardware trigger
- CRC - programmable cyclic redundancy check module
- FTM - three flex timer modulators modules including one 6 -channel and two 2 -channel ones; 16-bit counter; each channel can be configured for input capture, output compare, edge- or centeraligned PWM mode
- IIC - One inter-integrated circuit module; up to 400 kbps; multi-master operation; programmable slave address; supporting broadcast mode and 10-bit addressing; supporting SMBUS and PMBUS
- MTIM - Two modulo timers with 8-bit prescaler and overflow interrupt
- RTC - 16-bit real timer counter (RTC)
- SCI - three serial communication interface (SCI/ UART) modules optional 13-bit break; full duplex non-return to zero (NRZ); LIN extension support
- SPI - one 8-bit and one 16-bit serial peripheral interface (SPI) modules; full-duplex or single-wire bidirectional; master or slave mode
- Input/Output
- Up to 57 GPIOs including one output-only pin
- Two 8-bit keyboard interrupt modules (KBI)
- Two true open-drain output pins
- Eight, ultra-high current sink pins supporting 20 mA source/sink current
- Package options
- 64-pin LQFP; 64-pin QFP
- 48-pin LQFP
- 44-pin LQFP
- 32-pin LQFP

## 1 Ordering parts

### 1.1 Determining valid orderable parts

Valid orderable part numbers are provided on the web. To determine the orderable part numbers for this device, go to freescale.com and perform a part number search for the following device numbers: PA60 and PA32.

## 2 Part identification

### 2.1 Description

Part numbers for the chip have fields that identify the specific part. You can use the values of these fields to determine the specific part you have received.

### 2.2 Format

Part numbers for this device have the following format:
MC 9 S08 PA AA (V) B CC

### 2.3 Fields

This table lists the possible values for each field in the part number (not all combinations are valid):

| Field | Description | Values |
| :--- | :--- | :--- |
| MC | Qualification status | $\bullet$ MC = fully qualified, general market flow |
| 9 | Memory | $\bullet 9=$ flash based |
| S08 | Core | $\bullet$ S08 = 8-bit CPU |
| PA | Device family | $\bullet$ PA |
| AA | Approximate flash size in KB | $\bullet 60=60 \mathrm{~KB}$ <br> $\bullet 32=32 \mathrm{~KB}$ |
| (V) | Mask set version | • (blank) $=$ Any version <br>  |
|  |  | A Rev. 2 or later version, this is <br> recommended for new design |

Table continues on the next page...

| Field | Description | Values |
| :--- | :--- | :--- |
| B | Operating temperature range $\left({ }^{\circ} \mathrm{C}\right)$ | $\bullet \mathrm{V}=-40$ to 105 |
| CC | Package designator | $\bullet$ QH $=64$-pin QFP |
|  |  | $\bullet$ LH $=64$-pin LQPP |
|  |  | $\bullet$ LF $=48$-pin LQFP |
|  |  | $\bullet$ LD $=44$-pin LQFP |
|  |  |  |

### 2.4 Example

This is an example part number:
MC9S08PA60VQH

## 3 Parameter Classification

The electrical parameters shown in this supplement are guaranteed by various methods.
To give the customer a better understanding, the following classification is used and the parameters are tagged accordingly in the tables where appropriate:

Table 1. Parameter Classifications

| P | Those parameters are guaranteed during production testing on each individual device. |
| :---: | :--- |
| C | Those parameters are achieved by the design characterization by measuring a statistically relevant sample size <br> across process variations. |
| T | Those parameters are achieved by design characterization on a small sample size from typical devices under <br> typical conditions unless otherwise noted. All values shown in the typical column are within this category. |
| D | Those parameters are derived mainly from simulations. |

## NOTE

The classification is shown in the column labeled "C" in the parameter tables where appropriate.

## 4 Ratings

### 4.1 Thermal handling ratings

| Symbol | Description | Min. | Max. | Unit | Notes |
| :---: | :--- | :---: | :---: | :---: | :---: |
| $\mathrm{T}_{\text {STG }}$ | Storage temperature | -55 | 150 | ${ }^{\circ} \mathrm{C}$ | 1 |
| $\mathrm{~T}_{\text {SDR }}$ | Solder temperature, lead-free | - | 260 | ${ }^{\circ} \mathrm{C}$ | 2 |

1. Determined according to JEDEC Standard JESD22-A103, High Temperature Storage Life.
2. Determined according to IPC/JEDEC Standard J-STD-020, Moisture/Reflow Sensitivity Classification for Nonhermetic Solid State Surface Mount Devices.

### 4.2 Moisture handling ratings

| Symbol | Description | Min. | Max. | Unit | Notes |
| :---: | :--- | :---: | :---: | :---: | :---: |
| MSL | Moisture sensitivity level | - | 3 | - | 1 |

1. Determined according to IPC/JEDEC Standard J-STD-020, Moisture/Reflow Sensitivity Classification for Nonhermetic Solid State Surface Mount Devices.

### 4.3 ESD handling ratings

| Symbol | Description | Min. | Max. | Unit | Notes |
| :---: | :--- | :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\text {HBM }}$ | Electrostatic discharge voltage, human body model | -6000 | +6000 | V | 1 |
| $\mathrm{~V}_{\text {CDM }}$ | Electrostatic discharge voltage, charged-device model | -500 | +500 | V | 2 |
| $\mathrm{I}_{\text {LAT }}$ | Latch-up current at ambient temperature of $105^{\circ} \mathrm{C}$ | -100 | +100 | mA |  |

1. Determined according to JEDEC Standard JESD22-A114, Electrostatic Discharge (ESD) Sensitivity Testing Human Body Model (HBM).
2. Determined according to JEDEC Standard JESD22-C101, Field-Induced Charged-Device Model Test Method for Electrostatic-Discharge-Withstand Thresholds of Microelectronic Components.

### 4.4 Voltage and current operating ratings

Absolute maximum ratings are stress ratings only, and functional operation at the maxima is not guaranteed. Stress beyond the limits specified in below table may affect device reliability or cause permanent damage to the device. For functional operating conditions, refer to the remaining tables in this document.

This device contains circuitry protecting against damage due to high static voltage or electrical fields; however, it is advised that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (for instance, either $\mathrm{V}_{\mathrm{SS}}$ or $\mathrm{V}_{\mathrm{DD}}$ ) or the programmable pullup resistor associated with the pin is enabled.

| Symbol | Description | Min. | Max. | Unit |
| :---: | :---: | :---: | :---: | :---: |
| $V_{\text {DD }}$ | Supply voltage | -0.3 | 6.0 | V |
| $\mathrm{I}_{\mathrm{DD}}$ | Maximum current into $\mathrm{V}_{\mathrm{DD}}$ | - | 120 | mA |
| $\mathrm{V}_{\text {DIO }}$ | Digital input voltage (except $\overline{\text { RESET, EXTAL, XTAL, or true }}$ open drain pin PTA2 and PTA3) | -0.3 | $\mathrm{V}_{\mathrm{DD}}+0.3$ | V |
|  | Digital input voltage (true open drain pin PTA2 and PTA3) | -0.3 | 6 | V |
| $\mathrm{V}_{\text {AIO }}$ | Analog ${ }^{1}$, $\overline{\text { RESET, EXTAL, and XTAL input voltage }}$ | -0.3 | $\mathrm{V}_{\mathrm{DD}}+0.3$ | V |
| $\mathrm{I}_{\mathrm{D}}$ | Instantaneous maximum current single pin limit (applies to all port pins) | -25 | 25 | mA |
| $\mathrm{V}_{\text {DDA }}$ | Analog supply voltage | $\mathrm{V}_{\mathrm{DD}}-0.3$ | $\mathrm{V}_{\mathrm{DD}}+0.3$ | V |

1. All digital I/O pins, except open-drain pin PTA2 and PTA3, are internally clamped to $\mathrm{V}_{\mathrm{SS}}$ and $\mathrm{V}_{\mathrm{DD}}$. PTA2 and PTA3 is only clamped to $\mathrm{V}_{\mathrm{Ss}}$.

## 5 General

### 5.1 Nonswitching electrical specifications

### 5.1.1 DC characteristics

This section includes information about power supply requirements and I/O pin characteristics.

| $\mathrm{V}_{\text {RAM }}$ | C | RAM re | retention voltage | - | 2.0 | - | - | V |

1. Typical values are measured at $25^{\circ} \mathrm{C}$. Characterized, not tested.
2. Only PTB4, PTB5, PTD0, PTD1, PTE0, PTE1, PTH0, and PTH1 support ultra high current output.
3. The specified resistor value is the actual value internal to the device. The pullup value may appear higher when measured externally on the pin.
4. All functional non-supply pins, except for PTA2 and PTA3, are internally clamped to $\mathrm{V}_{S S}$ and $\mathrm{V}_{\mathrm{DD}}$.
5. Input must be current-limited to the value specified. To determine the value of the required current-limiting resistor, calculate resistance values for positive and negative clamp voltages, then use the large one.
6. Power supply must maintain regulation within operating $V_{D D}$ range during instantaneous and operating maximum current conditions. If the positive injection current $\left(\mathrm{V}_{\mathrm{In}}>\mathrm{V}_{\mathrm{DD}}\right)$ is higher than $\mathrm{I}_{\mathrm{DD}}$, the injection current may flow out of $\mathrm{V}_{\mathrm{DD}}$ and could result in external power supply going out of regulation. Ensure that external $\mathrm{V}_{\mathrm{DD}}$ load will shunt current higher than maximum injection current when the MCU is not consuming power, such as no system clock is present, or clock rate is very low (which would reduce overall power consumption).

3. ACMP adder cause $<10 \mu \mathrm{~A} \mathrm{I}_{\mathrm{DD}}$ increase typically.
4. LVD is periodically woken up from stop3 by $5 \%$ duty cycle. The period is equal to or less than 2 ms .

### 5.1.3 EMC performance

Electromagnetic compatibility (EMC) performance is highly dependent on the environment in which the MCU resides. Board design and layout, circuit topology choices, location and characteristics of external components as well as MCU software operation all play a significant role in EMC performance. The system designer should consult Freescale applications notes such as AN2321, AN1050, AN1263, AN2764, and AN1259 for advice and guidance specifically targeted at optimizing EMC performance.

1. Determined according to IEC Standard 61967-1, Integrated Circuits - Measurement of Electromagnetic Emissions, 150 kHz to 1 GHz Part 1: General Conditions and Definitions and IEC Standard 61967-2, Integrated Circuits - Measurement of Electromagnetic Emissions, 150 kHz to 1 GHz Part 2: Measurement of Radiated Emissions - TEM Cell and Wideband TEM Cell Method. Measurements were made while the microcontroller was running basic application code. The reported emission level is the value of the maximum measured emission, rounded up to the next whole number, from among the measured orientations in each frequency range.
2. $\mathrm{V}_{\mathrm{DD}}=5.0 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=25^{\circ} \mathrm{C}, \mathrm{f}_{\mathrm{OSC}}=10 \mathrm{MHz}$ (crystal), $\mathrm{f}_{\mathrm{SYS}}=20 \mathrm{MHz}, \mathrm{f}_{\mathrm{BUS}}=20 \mathrm{MHz}$

1. Typical values are based on characterization data at $\mathrm{V}_{\mathrm{DD}}=5.0 \mathrm{~V}, 25^{\circ} \mathrm{C}$ unless otherwise stated.
2. This is the shortest pulse that is guaranteed to be recognized as a reset pin request.
3. To enter BDM mode following a POR, BKGD/MS must be held low during the powerup and for a hold time of $\mathrm{t}_{\mathrm{MSH}}$ after $V_{D D}$ rises above $V_{L V D}$.
4. This is the minimum pulse width that is guaranteed to pass through the pin synchronization circuitry. Shorter pulses may or may not be recognized. In stop mode, the synchronizer is bypassed so shorter pulses can be recognized.
5. Timing is shown with respect to $20 \% \mathrm{~V}_{\mathrm{DD}}$ and $80 \% \mathrm{~V}_{\mathrm{DD}}$ levels in operating temperature range.

### 5.3.1 Thermal operating requirements

Table 9. Thermal operating requirements

| Symbol | Description | Min. | Max. | Unit |
| :---: | :--- | :---: | :---: | :---: |

| $\mathrm{T}_{\mathrm{A}}$ | Ambient temperature | -40 | 105 | ${ }^{\circ} \mathrm{C}$ |

## NOTE

Maximum $\mathrm{T}_{\mathrm{A}}$ can be exceeded only if the user ensures that $\mathrm{T}_{\mathrm{J}}$ does not exceed the maximum. The simplest method to determine $T_{J}$ is: $T_{J}=T_{A}+R_{\theta J A} \times$ chip power dissipation.

### 5.3.2 Thermal characteristics

This section provides information about operating temperature range, power dissipation, and package thermal resistance. Power dissipation on I/O pins is usually small compared to the power dissipation in on-chip logic and voltage regulator circuits, and it is userdetermined rather than being controlled by the MCU design. To take $\mathrm{P}_{\mathrm{I} / \mathrm{O}}$ into account in power calculations, determine the difference between actual pin voltage and $\mathrm{V}_{\mathrm{SS}}$ or $\mathrm{V}_{\mathrm{DD}}$ and multiply by the pin current for each I/O pin. Except in cases of unusually high pin current (heavy loads), the difference between pin voltage and $\mathrm{V}_{\mathrm{SS}}$ or $\mathrm{V}_{\mathrm{DD}}$ will be very small.

1. Data in Typical column was characterized at $5.0 \mathrm{~V}, 25^{\circ} \mathrm{C}$ or is typical recommended value.
2. When ICS is configured for FEE or FBE mode, input clock source must be divisible using RDIV to within the range of 31.25 kHz to 39.0625 kHz .
3. See crystal or resonator manufacturer's recommendation.
4. Load capacitors $\left(C_{1}, C_{2}\right)$, feedback resistor $\left(R_{F}\right)$ and series resistor $\left(R_{S}\right)$ are incorporated internally when RANGE $=H G O=$ 0.
5. This parameter is characterized and not tested on each device.
6. Proper PC board layout procedures must be followed to achieve specifications.
7. This specification applies to any time the FLL reference source or reference divider is changed, trim value changed, or changing from FLL disabled (FBELP, FBILP) to FLL enabled (FEI, FEE, FBE, FBI). If a crystal/resonator is being used as the reference, this specification assumes it is already running.
8. Jitter is the average deviation from the programmed frequency measured over the specified interval at maximum $f_{\text {Bus }}$. Measurements are made with the device powered by filtered supplies and clocked by a stable external clock signal. Noise injected into the FLL circuitry via $V_{D D}$ and $V_{S S}$ and variation in crystal oscillator frequency increase the $C_{J i t t e r}$ percentage for a given interval.

### 6.4 Communication interfaces

### 6.4.1 SPI switching specifications

The serial peripheral interface (SPI) provides a synchronous serial bus with master and slave operations. Many of the transfer attributes are programmable. The following tables provide timing characteristics for classic SPI timing modes. Refer to the SPI chapter of the chip's reference manual for information about the modified transfer formats used for
communicating with slower peripheral devices. All timing is shown with respect to $20 \%$ $\mathrm{V}_{\mathrm{DD}}$ and $70 \% \mathrm{~V}_{\mathrm{DD}}$, unless noted, and 100 pF load on all SPI pins. All timing assumes high drive strength is enabled for SPI output pins.

## 7 Dimensions

### 7.1 Obtaining package dimensions

Package dimensions are provided in package drawings.

To find a package drawing, go to freescale.com and perform a keyword search for the drawing's document number:

| If you want the drawing for this package | Then use this document number |

2. This is a true open-drain pin when operated as output.

## Note

When an alternative function is first enabled, it is possible to get a spurious edge to the module. User software must clear any associated flags before interrupts are enabled. The table above illustrates the priority if multiple modules are enabled. The highest priority module will have control over the pin. Selecting a higher priority pin function with a lower priority function already enabled can cause spurious edges to the lower priority module. Disable all modules that share a pin before enabling another module.
