To our customers,

Old Company Name in Catalogs and Other Documents

On April 1st, 2010, NEC Electronics Corporation merged with Renesas Technology Corporation, and Renesas Electronics Corporation took over all the business of both companies. Therefore, although the old company name remains in this document, it is a valid Renesas Electronics document. We appreciate your understanding.

General Precautions for Handling This Product

1. Circumstances not covered by product guarantee
- If the product was disassembled, altered, or repaired by the customer
- If it was dropped, broken, or given another strong shock
- Use at overvoltage, use outside guaranteed temperature range, storing outside guaranteed temperature range
- If power was turned on while connection to the AC adapter, USB interface cable, or target system was in an unsatisfactory state
- If the cable of the AC adapter, the USB interface cable, the emulation probe, or the like was bent or pulled excessively
- If an AC adapter other than the supplied product was used
- If the product got wet
- If this product is connected to the target system when there is a potential difference between the GND of this product and GND of the target system.
- If the connectors or cables are plugged/unplugged while this product is in the power-on state.
- If excessive load is applied to the connectors or sockets (As for handling, please see **2.5 Mounting and Connecting Connectors)**.
- If the product is used or stored in an environment where an electrostatic or electrical noise is likely to occur

2. Safety precautions
- If used for a long time, the product may become hot ($50°C$ to $60°C$). Be careful of low temperature burns and other dangers due to the product becoming hot.
- Be careful of electrical shock. There is a danger of electrical shock if the product is used as described above in **1 Circumstances not covered by product guarantee**.

INTRODUCTION

Readers   This manual is intended for users who wish to perform debugging using the QB-78K0KX2. The readers of this manual are assumed to be familiar with the device functions and usage, and to have knowledge of debuggers.

Purpose   This manual is intended to give users an understanding of the basic specifications and correct usage of the QB-78K0KX2.

Organization   This manual is divided into the following sections.

- General
- Setup procedure
- Settings at product shipment
- Differences between target interface circuit and target device
- Notes

How to Read This Manual   It is assumed that the readers of this manual have general knowledge in the fields of electrical engineering, logic circuits, and microcontrollers.
This manual describes the basic setup procedures and how to set switches.

To understand the overall functions and usages of the QB-78K0KX2
→Read this manual according to the **CONTENTS**. The mark <R> shows major revised points. The revised points can be easily searched by copying an "<R>" in the PDF file and specifying it in the "Find what:" field.

To know the manipulations, command functions, and other software-related settings of the QB-78K0KX2
→See the user's manual of the debugger (supplied with the QB-78K0KX2) to be used.

Terminology

The meanings of the terms used in this manual are described in the table below.

Term	Meaning
Target device	This is the device to be emulated.
Target system	This is the system to be debugged. This includes the target program and the hardware provided by the user.
78K0/Kx2	Generic name indicating 78K0/KB2, 78K0/KC2, 78K0/KD2, 78K0/KE2, and 78K0/KF2.
IECUBE™	Generic name for NEC Electronics' high-performance/compact in-circuit emulator.

CHAPTER   1   GENERAL

The QB-78K0KX2 is an in-circuit emulator for emulating the 78K0/Kx2.

Hardware and software can be debugged efficiently in the development of systems in which the 78K0/Kx2 is used. This manual descries basic setup procedures, hardware specifications, system specifications, and how to set switches.

1.1 Hardware Specifications

Table 1-1. QB-78K0KX2 Hardware Specifications

Parameter		Specification	
Target device		78K0/KB2, 78K0/KC2, 78K0/KD2, 78K0/KE2, 78K0/KF2	
Operating voltage		1.8 to 5.5 V	
Operating frequency		Main system clock	V_{DD} = 4.0 to 5.5 V: 20 MHz V_{DD} = 2.7 to 5.5 V: 10 MHz V_{DD} = 1.8 to 5.5 V: 5 MHz
		Internal oscillation clock	Internal high-speed oscillation clock V_{DD} = 2.7 to 5.5 V: 8 MHz (TYP.) Internal low-speed oscillation clock V_{DD} = 2.7 to 5.5 V: 240 kHz (TYP.) (120 to 480 kHz)
		Subsystem clock	V_{DD} = 1.8 to 5.5 V: 32.768 kHz
Operating temperature range		0 to 40°C (No condensation)	
Storage temperature range		−15 to 60°C (No condensation)	
External dimensions		See figure below	
Power consumption	AC adapter for QB-78K0KX2	15 V, 1 A	
	Target system power supply	Voltage: 1.8 to 5.5 V Current: target device's current consumption + 10 mA (approx.)	
Weight		300 g	
Host interface		USB interface (1.1, 2.0)	

112.7 mm[Note 1] 108.2 mm[Note 2] 58 mm[Note 3] Rear space adapter Front space adapter[Note 4]
Notes 1. Does not include projection of power switch
    2. Includes projection of screw that fixes rear space adapter
    3. Dimension when rear space adapter is made shortest (88 mm when longest)
    4. Front space adapter can vary from 20 mm (longest) to 5 mm (shortest)

1.2 System Specifications

This section shows the QB-78K0KX2 system specifications.

Table 1-2. QB-78K0KX2 System Specifications

Parameter		Specification
Emulation memory capacity	Internal ROM	128 KB (MAX.)
	Internal high-speed ROM	1 KB (MAX.)
	Internal expansion RAM	6 KB (MAX.)
Program execution functions	Real-time execution function	Go, Start from Here, Go & Go, Come Here, Restart, Return Out, Ignore break points and Go
	Non-real-time execution function	Step execution
Break functions	Event break	Execution: 8 points Access: Byte 8 points, word 2 points
	Software break	2000 points
	Pre-execution break	16 points
	Fail-safe break	Exists
	Other	Forcible break, trace full break, trace delay break, timeout break, timer overflow break
Trace functions	Trace data types	Program address, program data, access address, access data, status
	Trace modes	Full trace, section trace, qualify trace
	Trace functions	Delay function, full stop function
	Memory capacity	128K frames
Real-time RAM monitoring function		All spaces
Time measurement functions	Measurement clock	50 MHz or CPU clock
	Measurement objects	Beginning through end of program execution Start event through end event
	Maximum measurement time	Approximately 48 hours and 50 minutes (Resolution 41 μs)
	Minimum resolution	20 ns (Measuring time: 85 seconds)
	Number of timers for measurement	Start through end of program execution: 1 Start event through end event: 2
	Measurement results	Maximum, minimum, average, cumulative, number of passes (between events)
	Other	Timer overflow break function, timeout break function
Other functions		Mapping function, event function, coverage function, snapshot function, DMM function, stub function, power-off emulation function, pin mask function

1.3 System Configuration

This section shows the system configuration when using the QB-78K0KX2 connected to a PC (PC-9821 series, PC/AT^{TM} compatible). Connection is possible even without optional products.

The following products are sold as single items.

    • Emulation probe   • Exchange adapter

    • YQ connector [Note]   • Target connector

    • Check pin adapter   • Space adapter [Note]

    • Mount adapter [Note]

    Note   Both 36FC and 64FC do not have YQ connectors, space adapters, and mount adapters.

CHAPTER 2 SETUP PROCEDURE

This chapter explains the QB-78K0KX2 setup procedure.

Setup can be completed by performing installation setup in the order in which it appears in this chapter.

Perform setup along the lines of the following procedure.

See **2.1 Names and Functions of Hardware** for clock board positions.

Clock settings
If using the internal clock, hardware settings are not required.
If mounting an oscillator is required, see **2.2 Removal of Acrylic Board** and **2.3 Clock Settings**.

Software settings
See **2.4 Software Settings**.

Mounting and connecting connectors
See **2.5 Mounting and Connecting Connectors**.

Connecting QB-78K0KX2 to target system
See **2.6 Connecting QB-78K0KX2 to Target System**.

Connecting USB interface cable and AC adapter
See **2.8 Connecting USB Interface Cable and AC Adapter**.

Switching power on and off
See **2.9 Switching Power On and Off**.

Note It is not necessary for user to use CN4.

(4) POWER (Red LED)

This is an LED that shows whether or not the power supply of the QB-78K0KX2 is switched on.

LED State	QB-78K0KX2 State
Lit	Power switch ON
Not lit	Power switch OFF or AC adapter not connected to QB-78K0KX2
Blinking	Internal error occurred (Contact an NEC Electronics sales representative or distributor)

(5) TARGET (Green LED)

This is an LED that shows whether or not the power supply of the target system is switched on.

LED State	Target System State
Lit	Target system power supply ON
Not lit	Target system power supply OFF or target system not connected

(6) Power switch

This is the power switch of the QB-78K0KX2.
It is OFF at shipment.

2.2 Removal of Acrylic Board

To modify the clock setting, the acrylic board on the bottom of the QB-78K0KX2 must be removed.
The acrylic board can be removed by lifting it up.

Figure 2-2.   Acrylic Board Removal Method
<R> 2.3 Clock Settings

2.3.1 Overview of clock settings

The following 5 types of clock settings are available.
For details, see **2.3.2 Clock setting methods**.

Main system clock:
(1)   Using the clock generated in the emulator (with high-speed internal oscillator used)
(2)   Suppling a clock (square wave) from the target system
(3)   Using the oscillator (OSC1) mounted in the emulator

Subsystem clock:
(1)   Using the clock generated in the emulator
(2)   Suppling a clock (square wave) from the target system

2.3.2 Clock setting methods

This section shows the clock settings.

Table 2-1. Main System Clock Setting

Type of Clock to Be Used	OSC1	Debugger Setting
(1) Using the clock generated in the emulator (with high-speed internal oscillator used)	–	System
(2) Suppling a clock (square wave) from the target system[Note]	–	External
(3) Using the oscillator (OSC1) mounted in the emulator	Mount oscillator	Clock Board

Note Do not select this setting when the TARGET LED is not lit.

Remarks 1. Settings other than those above are prohibited.

2. Selection of (1) or (2) is possible regardless of whether or not the oscillator is mounted onto OSC1.

Table 2-2. Subsystem Clock Setting

Type of Clock to Be Used	Remarks
(1) Using the clock generated in the emulator	System
(2) Suppling a clock (square wave) from the target system[Note]	External

Note Do not select this setting when the TARGET LED is not lit.

Remark Settings other than those above are prohibited.

2.3.3 Main system clock

(1) Using the clock generated in the emulater (with high-speed internal oscillator used)

Select "System" in the configuration dialog box of the debugger and select the desired frequency from the dialog menu.

(2) Suppling a clock (square wave) from the target system

Select "External" in the configuration dialog box of the debugger to use the clock input from the target system. To input the clock from the target system, input to the clock pin (X2) the square wave[Note] with the same potential as the target device (inputting the inverted waveform to the X1 pin is unnecessary).

Note Square waves from oscillators using a resonator are not supported.

(3) Using the oscillator (OSC1) mounted in the emulator

♦Things to prepare
  • Oscillator [Note] (with pins as shown in Figure 2-3 and a 5 V power supply)

Figure 2-3.   Oscillator (Main System Clock)

Note   Oscillation circuits using resonators cannot be used.

<Procedure>
<1> Mount the prepared oscillator onto OSC1.   When mounting the oscillator onto OSC1, be sure to insert it in the direction of pin 1.

Figure 2-4.   Allignment of Oscillator to Socket (Main System Clock)

Oscillator Pin	OSC1 Pin Number
NC	1
GND	4
	7
CLOCK OUT	8
	11
Vcc	14
<2> Set the "Clock Board" in the configuration dialog box of the debugger.

For the frequency at this time, the clock of the oscillator mounted onto OSC1 is used.

2.3.4 Subsystem clock

(1) For mounting internally generated clock

Select "System" in the configuration dialog box of the debugger and select the desired frequency from the dialog menu.

(2) For using target system clock

Select "External" in the configuration dialog box of the debugger to use the clock input from the target system.
To input the clock from the target system, input to the clock pin (XT2) the square wave with the same potential as the target device (inputting the inverted waveform to the XT1 pin is unnecessary).

For details, see the **ID78K0-QB Ver. 2.90 Integrated Debugger Operation User's Manual (U17437E)**.

2.5 Mounting and Connecting Connectors

This section describes the methods of connecting the QB-78K0KX2 and target system.
Make connections with both the QB-78K0KX2 and target system powered OFF.
The following abbreviations are used in this section.
- NQ: Target connector
- YQ: YQ connector
- EA: Exchange adapter
- HQ: Mount adapter
- CA: Check pin adapter
- YS: Space adapter

2.5.1 Mounting NQ in target system

(1) Thinly apply a two-component epoxy adhesive (hardening time at least 30 minutes) to the ends of the four projections on the base of the NQ and adhere the NQ to the user board (clean the surface of the user board using alcohol or the like). If alignment of user board pads to NQ leads is difficult, align them as in (2).

(2) Align by inserting the guide pins for alignment for the NQ (NQ-Guide) through the pin holes on the top of the NQ. Accessory holes are ϕ1.0 mm non-through holes in 2 or 3 places.
(For hole positions, see the particular NQ drawing.)

(3) Solder after fitting the HQ to the NQ. This is to prevent troubles such as flux or solder splatter and adhering to the NQ contact pins when soldering.
- Soldering conditions
    Solder reflow (FC package) At 260°C for a maximum of 10 seconds
    Solder reflow (except for FC package) At 240°C for a maximum of 20 seconds
    Manual soldering At 240°C for a maximum of 10 seconds
    (1 pin)

Caution Do not perform washing by flux immersion or vapor.

(4) Take away the guide pins.

2.5.2 Mounting YQ on NQ

(1) After confirming that there are no broken or bent YQ contact pins, fit the YQ in the NQ and fasten the screw. If repeatedly inserting and removing, be sure to inspect the YQ pins before fitting. If pins are bent, correct them using something thin and flat such as the edge of a knife.

(2) Accessory holes are needed in prescribed positions in 4 places in the board for connecting the YQ. Fasten the YQ to the NQ on the user board using the supplied M2 $\times$ 10 mm screws. The thickness of a board corresponding to these screws is 1.0 to 2.0 mm. Fasten the screws equally in the four corners using a No. 1 or No. 0 precision (+) driver or torque driver. The tightening torque of the screws is 0.054 Nm (MAX.). Too great tightening causes bad connections.

Screws for fitting to the NQ (M2 $\times$ 10 mm/4) are included with the YQ.

2.5.3 Plugging EA into YQ

Match the No. 1 pin position of the YQ or YS (C cuts match in both) to the No. 1 pin position of the EA and plug in.

- When plugging or unplugging, press on the NQ, YQ, and YS with a finger so that there is no force on the NQ.
- When plugging or unplugging, be careful of the direction of rocking.

As a tool when unplugging, insert some kind of thin non-conductive material such as a wooden stick between the YQ (YS) and EA and rock while slowly unplugging. Be careful since the connector will be damaged if this is done in the wrong direction.

2.5.4 Notes on handling NQ, YQ, and YS

(1) When taking the NQ from the box, press down on the body and take out the sponge first.

(2) Since the pins of the YQ are thin and easily bent, be careful. When inserting it in the NQ, confirm that there are no bent pins.

(3) When screwing a YQ soldered to a board to the NQ, fasten the screws in four places in turn using a No. 0 or No. 1 Phillips precision driver or torque driver after tentatively tightening them. Fix the torque at 0.054 Nm (MAX.). If just one place is overtightened, it may cause poor contact. Moreover, a board being connected to the YQ must have accessory holes in prescribed positions (4 places: ϕ2.3 mm or ϕ3.3 mm). The ϕ3.8 mm or ϕ4.3 mm that is the screw head size is an area where wiring is prohibited.

(4) In YQ and YS removal, since there is a danger of YQ pins being bent or broken when prying and rocking, remove them gradually using a screwdriver from four directions. Moreover, to connect and use the YQ and YS, screw the YQ to the NQ according to the YQGUIDE (sold separately) using a 2.3 mm screwdriver and then connect it to the YS. Fix the torque at 0.054 Nm (MAX.). If even one place is overtightened, it may cause poor contact.

(5) For the NQ, YQ, and YS, since there is a danger that washing fluid on the structure will remain in the connector, do not perform washing.

(6) NQ, IC, and YQ cannot be used in combination.

(7) An NQ/YQ system cannot be used in an environment of vibrations or shocks.

(8) It is assumed that this product will be used in system development and evaluation. Moreover, when used in Japan, Electrical Appliance and Material Control Law and electromagnetic disturbance countermeasures have not been applied.

(9) Since there are rare cases of shape change if the box is left for a long time in a place where it is 50°C or higher, for safekeeping, store it in a place where it is no higher than 40°C and direct sunlight does not hit it.

(10) For details about handling the NQ, YQ, and YS, see the NQPACK series technical materials at the website of Tokyo Eletech Corporation.
Tokyo Eletech Corporation website: http://www.tetc.co.jp/

2.5.5 Notes on mounting NQ and IC

(1) Confirm that there is no weld flash in the resin (sealant part) of the IC.   If there is weld flash, remove it using a knife or the like.

(2) Confirm that there is no weld flash breaking or bending of IC leads.   In particular, confirm the planarity of IC leads.   If there is abnormality in the planarity, correct that portion.

(3) Viewing the NQ contact pins from the top, if there are foreign bodies on them, remove them using a brush or the like.
     After confirming (1) to (3), fit the IC to the NQ.   Also fit the HQ.

(4) Put the supplied M2 × 6 mm screws in the 4 accessory holes of the HQ and fasten the screws in opposite corners.   At that time, use either the dedicated screw driver that is supplied or a torque driver to fasten them equally in turn with a tightening torque of 0.054 Nm (MAX.).   Since the contact is poor if tightening is too great, once you have lightly fastened the HQ screws, tighten them again.

(5) Depending on the use environment, when starting up a device that has been left for a long time, starting it may be difficult.   In this case, loosen the screws slightly and then retighten them.

(6) If startup still is difficult after (5) above, check (1) to (3) again.

(7) Tightening the screws of the HQ too much may give rise to cracks in the molded part of the HQ (plastic part) and bend the mold into a bowed shape, making contact poor.

(8) After soldering the NQ, do not perform washing by flux immersion or vapor.

2.6   Connecting QB-78K0KX2 to Target System

If connecting the emulation probe (QB-80-EP-01T), connect it to the QB-78K0KX2 and the target system by the following procedure.

(a) Connection of emulation probe
Connect the emulation probe to the QB-78K0KX2.

Figure 2-5.   Emulation Probe Connection Method
Insert CN1 and CN2 of the probe into
TCN1 and TCN2 of the QB-78K0KX2.

(b) Connection of emulation probe GND wire

There are 2 GND wires in the emulation probe. Connect them to the QB-78K0KX2 and target system.

<1> Fasten the GND wire on the QB-78K0KX2 side of the emulation probe to the nut on the bottom of the QB-78K0KX2 using a #0 or #1 Phillips precision driver (connection of B to A in Figure 2-6).

<2> Next plug the connector on top of the emulation probe into the connector at the opening on the bottom of the QB-78K0KX2 from below being careful of the insertion direction.

Figure 2-6. GND Wire
Target system

<3> Connect the exchange adapter and emulation probe to the target connector.

<4> Connect the GND wire on the target system side of the emulation probe to the target system GND. If a pin or screw is fastened to the target system GND, remove the transparent terminal cover on the end of the GND wire and fasten the Y terminal of the GND wire to the target system (C in Figure 2-6). If the GND on the target system is an exposed pad, likewise fasten the Y terminal to the pad on the target system by soldering (recommended soldering iron temperature setting: 300°C).

<5> Since the length of the GND wire below the head (insulated part) is approximately 60 mm, there must be a GND to which it can be connected to within the range of an approximately 60 mm radius section of the target system for connecting the emulation probe, as shown in Figure 2-7.

Figure 2-7. Where GND Wire Can Be Connected
(c) Ensuring isolation

When connecting the target system to the QB-78K0KX2 using an emulation probe, adjust the height using the front space adapter or rear space adapter of the QB-78K0KX2 and ensure isolation from the target system.

Figure 2-8. Connection Using Emulation Probe
(d) Precautions related to emulation probe

The following precautions pertain to using the emulation probe.

<1> Be careful that stress of the emulation probe is not placed on the target connector. Moreover, when removing the emulation probe, remove it slowly while pressing down on the exchange adapter with a finger so that there is no stress on the target connector.

<2> Be sure to connect the GND wire of the emulation probe to the QB-78K0KX2 and the target system. If not, the impedance of the cable becomes unstable, resulting in the lowering of signal transmission characteristics or distortion of the output waveform for an input waveform.

2.7 Notes on Power Supply and GND Pin Connection

For power supplies and GND pins of the target device, be sure to connect all pins to each power supply or GND.

2.8 Connecting USB Interface Cable and AC Adapter

Plug the USB interface cable supplied with the QB-78K0KX2 into the USB connector of the host machine, and plug the other side into the USB connector on the rear of the QB-78K0KX2.

Plug the AC adapter supplied with the QB-78K0KX2 into a receptacle and plug the other side into the power supply connector on the rear of the QB-78K0KX2.

For QB-78K0KX2 connector positions, see **Figure 2-9**.   There are three types of AC adapter plug.   Use the one that has a suitable shape.

Figure 2-9.   Connector Positions

Power supply connector
(Connect AC adapter)

USB connector
(Connect USB interface cable)
2.9 Switching Power On and Off

Be sure to switch the power on and off according to the following procedures.
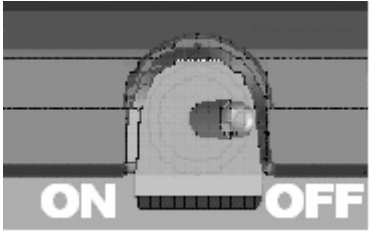

• Switching power on	• Switching power off
<1> QB-78K0KX2 power on	<1> Debugger termination
<2> Target system power on[Note]	<2> Target system power off[Note]
<3> Debugger startup	<3> QB-78K0KX2 power off

Note   In the procedures, <2> is unnecessary if the target system is not connected.

Caution   If the wrong sequence was used for the operation, the target system or QB-78K0KX2 may fail.

Note The oscillation circuit using an oscillation cannot be used.

CHAPTER 4 DIFFERENCES BETWEEN TARGET INTERFACE CIRCUIT AND TARGET DEVICE

This chapter explains the differences between the signal lines of a target interface circuit of the QB-78K0KX2 and the signal lines of a target device

Although the target device is a CMOS circuit, the target interface circuit of the QB-78K0KX2 consists of an emulation circuit that depends on the emulation CPU, TTL, CMOS-IC, or other.

When the target system is debugged by connecting it to the QB-78K0KX2, the QB-78K0KX2 emulates just as if the actual target device were operating on the target system.

However, small differences arise because the QB-78K0KX2 actually is emulating.

CHAPTER 5 NOTES

Observe the following notes.

- Do not turn off the target power supply (do not allow it to become lower than the POC voltage) during a break (power supply can be turned off only during RUN).
- When inputting the external clock, input the square waveform with the same potential as the target device to the clock pins (X2, XT2).
- Even when using the product without connecting a target system, connect and use the emulation probe and exchange adapter.
  If the product is used without connecting the emulation adapter and exchange adapter, a warning window is displayed but use is possible.
- A WDT reset is not generated when an area for which the capacities of the internal ROM, internal high-speed ROM, and internal expansion RAM are not set with the IMS and IXS registers is illegally accessed. Emulation is performed with a fail-safe break.
- Since a voltage around 1.7 V is set as a threshold value for POC detection by the emulator, it is different from the POC detection voltage of the device.
- The QB-78K0KX2 may be damaged if AV_{REF} is applied before the target powers V_{DD} and EV_{DD} are applied.
