

# MCF51AG128 ColdFire Microcontroller

## Covers: MCF51AG128 and MCF51AG96

The MCF51AG128 is a member of the ColdFire® family of 32-bit variable-length reduced instruction set (RISC) microcontroller. This document provides an overview of the MCF51AG128 series MCUs, focusing on its highly integrated and diverse feature set.

The MCF51AG128 derivative are low-cost, low-power, and high-performance 32-bit ColdFire V1 microcontroller units (MCUs) designed for industrial and appliance applications. It is an ideal upgrade for designs based on the MC9S08AC128 series of 8-bit microcontrollers.

The MCF51AG128 features the following functional units:

- 32-bit Version 1 ColdFire® central processor unit (CPU)
  - Up to 50.33 MHz ColdFire CPU from 2.7 V to 5.5 V
  - Provide 0.94 Dhrystone 2.1 DMIPS per MHz performance when running from internal RAM (0.76 DMIPS per MHz when running from flash)
  - Implements Coldfire Instruction Set Revision C (ISA\_C)
- On-chip memory
  - Up to 128 KB flash memory read/program/erase over full operating voltage and temperature
  - Up to 16 KB random access memory (RAM)
  - Security circuitry to prevent unauthorized access to RAM and flash contents
- Power-Saving Modes
  - Three ultra-low power stop modes and reduced power wait mode
  - Peripheral clock enable register can disable clocks to unused modules, thereby reducing currents
- System Protection
  - Advanced independent clocked watchdog (WDOG) with features like, robust refresh mechanism, windowed mode, high granulation timeout, fast test of timeout, and always forces a reset
  - Additional external watchdog monitor (EWM) to help reset external circuits

## MCF51AG128

- Low-voltage detection with reset or interrupt
- Separate low voltage warning with selectable trip points
- Illegal opcode and illegal address detection with reset
- Flash block protection for each array to prevent accidental write/erasure
- Hardware CRC module to support fast cyclic redundancy checks
- Debug Support
  - Single-wire back ground debug interface
  - Real-time debug support, with six hardware breakpoints (4 PC, 1 address pair and 1 data) that can be configured into a 1- or 2-level trigger
  - On-chip trace buffer provides programmable start/stop recording conditions
  - Support for real-time program (and optional partial data) trace using the debug visibility bus
- DMA Controller
  - Four independently programmable DMA channels provide the means to directly transfer data between system memory and I/O peripherals
  - DMA enabled peripherals include IIC, SCI, SPI, FTM, HSCMP, ADC, RTC, and eGPIO, and the DMA request from these peripherals can be configured as DMA source or as an iEvent input
- CFI\_INTC
  - Support of 44 peripheral I/O interrupt requests and seven software (one per level) interrupt requests
  - Fixed association between interrupt request source, level and priority, up to two requests can be remapped to the highest maskable level and priority
  - Unique vector number for each interrupt source
  - Support for service routine interrupt acknowledge (software IACK) read cycles for improved system performance
  - Ability to mask any individual or all interrupt sources

Freescale reserves the right to change the detail specifications as may be required to permit improvements in the design of its products.

- System Clock Sources
  - Oscillator (XOSC) — Loop-control pierce oscillator; crystal or ceramic resonator range of 31.25 kHz to 38.4 kHz or 1 MHz to 16 MHz
  - Internal Clock Source (ICS) — Frequency-locked-loop (FLL) controlled by internal or external reference; trimmable internal reference allows 0.2% resolution and 2% deviation (1% across 0 to 70 °C)
- Peripherals
  - ADC — 24 analog inputs with 12 bits resolution; output formatted in 12-, 10- or 8-bit right-justified format; single or continuous conversion (automatic return to idle after single conversion); interrupt or DMA request when conversion complete; operation in low-power modes for lower noise operation; asynchronous clock source for lower noise operation; selectable asynchronous hardware conversion triggers from RTC, PDB, or iEvent; dual samples based on hardware triggers during ping-pong mode; on-chip temperature sensor
  - PDB — 16-bit of resolution with prescaler; seven possible trigger events input; positive transition of trigger event signal initiates the counter; support continuous trigger or single shot, bypass mode; supports two triggered delay outputs or ORed together; pulsed output could be used for HSCMP windowing signal
  - iEvent — User programmable combinational boolean output using the four selected iEvent input channels for use as interrupt requests, DMA transfer requests, or hardware triggers
  - FTM — Two 6-channel flexible timer/PWM modules with DMA request option; deadtime insertion is available for each complementary channel pair; channels operate as pairs with equal outputs, pairs with complimentary outputs or independent channels (with independent outputs); 16-bit free-running counter; the load of the FTM registers which have write buffer can be synchronized; write protection for critical registers; backwards compatible with TPM
  - TPM — 16-bit free-running or modulo up/down count operation; two channels, each channel may be input capture, output compare, or edge-aligned PWM; one interrupt per channel plus terminal count interrupt
  - CRC — High speed hardware CRC generator circuit using 16-bit shift register; CRC16-CCITT compliancy with  $x^{16} + x^{12} + x^5 + 1$  polynomial; error detection for all single, double, odd, and most multi-bit errors; programmable initial seed value
  - HSCMP — Two analog comparators with selectable interrupt on rising edge, falling edge, or either edges of comparator output; the positive and negative inputs of the comparator are both driven from 4-to-1 muxes; programmable voltage reference from two internal DACs; support DMA transfer
  - IIC — Compatible with IIC bus standard and SMBus version 2 features; up to 100 kbps with maximum bus loading; multi-master operation; software programmable for one of 64 different serial clock frequencies; programmable slave address and glitch input filter; interrupt driven byte-by-byte data transfer; arbitration lost interrupt with automatic mode switching from master to slave; calling address identification interrupt; bus busy detection; broadcast and 10-bit address extension; address matching causes wake-up when MCU is in Stop3 mode; DMA support
  - SCI — Two serial communications interface modules with optional 13-bit break; full-duplex, standard non-return-to-zero (NRZ) format; double-buffered transmitter and receiver with separate enables; 13-bit baud rate selection with /32 fractional divide; interrupt-driven or polled operation; hardware parity generation and checking; programmable 8-bit or 9-bit character length; receiver wakeup by idle-line or address-mark; address match feature in receiver to reduce address-mark wakeup ISR overhead; 1/16 bit-time noise detection; DMA transmission for both transmit and receive
  - SPI — Two serial peripheral interfaces with full-duplex or single-wire bidirectional option; double-buffered transmitter and receiver; master or slave mode operation; selectable MSB-first or LSB-first shifting; 8-bit or 16-bit data modes; programmable transmit bit rate; receive data buffer hardware match feature; DMA transmission for transmit and receive
- Input/Output
  - Up to 69 GPIOs and one Input-only pin
  - Interrupt or DMA request with selectable polarity on all input pins
  - Programmable glitch filter, hysteresis and configurable pull up/down device on all input pins
  - Configurable slew rate and drive strength on all output pins
  - Independent pin value register to read logic level on digital pin
  - Up to 16 rapid general purpose I/O (RGPIO) pins connected to the processor's local 32-bit platform bus with set, clear, and faster toggle functionality

# 1 MCF51AG128 Family Configurations

## 1.1 Device Comparison

The following table compares the various device derivatives available within the MCF51AG128 series MCUs.

**Table 1. MCF51AG128 Series Device Comparison**

Feature	MCF51AG128			MCF51AG96		
	80-pin	64-pin	48-pin	80-pin	64-pin	48-pin
Flash memory size (KB)	128			96		
RAM size (KB)	16					
ColdFire V1 core with BDM (background debug module)	Yes					
HSCMP (analog comparator)	2	2	1	2	2	1
ADC (analog-to-digital converter) channels (12-bit)	24	19	12	24	19	12
CRC (cyclic redundancy check)	Yes					
DAC	2	2	1	2	2	1
DMA controller	4-ch					
iEvent (intelligent Event module)	Yes					
EWM (External Watchdog Monitor)	Yes					
WDOG (Watchdog timer)	Yes					
RTC	Yes					
DBG (debug module)	Yes					
IIC (inter-integrated circuit)	1	1	No	1	1	No
IRQ (interrupt request input)	Yes					
INTC (interrupt controller)	Yes					
LVD (low-voltage detector)	Yes					
ICS (internal clock source)	Yes					
OSC (crystal oscillator)	Yes					
Port I/O <sup>1</sup>	69	53	39	69	53	39
RGPIO (rapid general-purpose I/O)	16	16	15	16	16	15
SCI (serial communications interface)	2					
SPI1 (serial peripheral interface)	Yes					
SPI2 (serial peripheral interface)	Yes	No	No	Yes	No	No
FTM1 (flexible timer module) channels	6 <sup>2</sup>					
FTM2 channels	6 <sup>2</sup>					

**Table 1. MCF51AG128 Series Device Comparison (continued)**

Feature	MCF51AG128			MCF51AG96		
	80-pin	64-pin	48-pin	80-pin	64-pin	48-pin
TPM3 (timer pulse-width modulator) channels	2					
Debug Visibility Bus	Yes	No	No	Yes	No	No

<sup>1</sup> Up to 16 pins on Ports E and F are shared with the ColdFire Rapid GPIO module.

<sup>2</sup> Some pins of FTMx might not be bonded on small package, therefore these channels could be used as soft timer only.

## 1.2 Block Diagram

Figure 1 shows the connections between the MCF51AG128 series pins and modules.

# MCF51AG128 Family Configurations

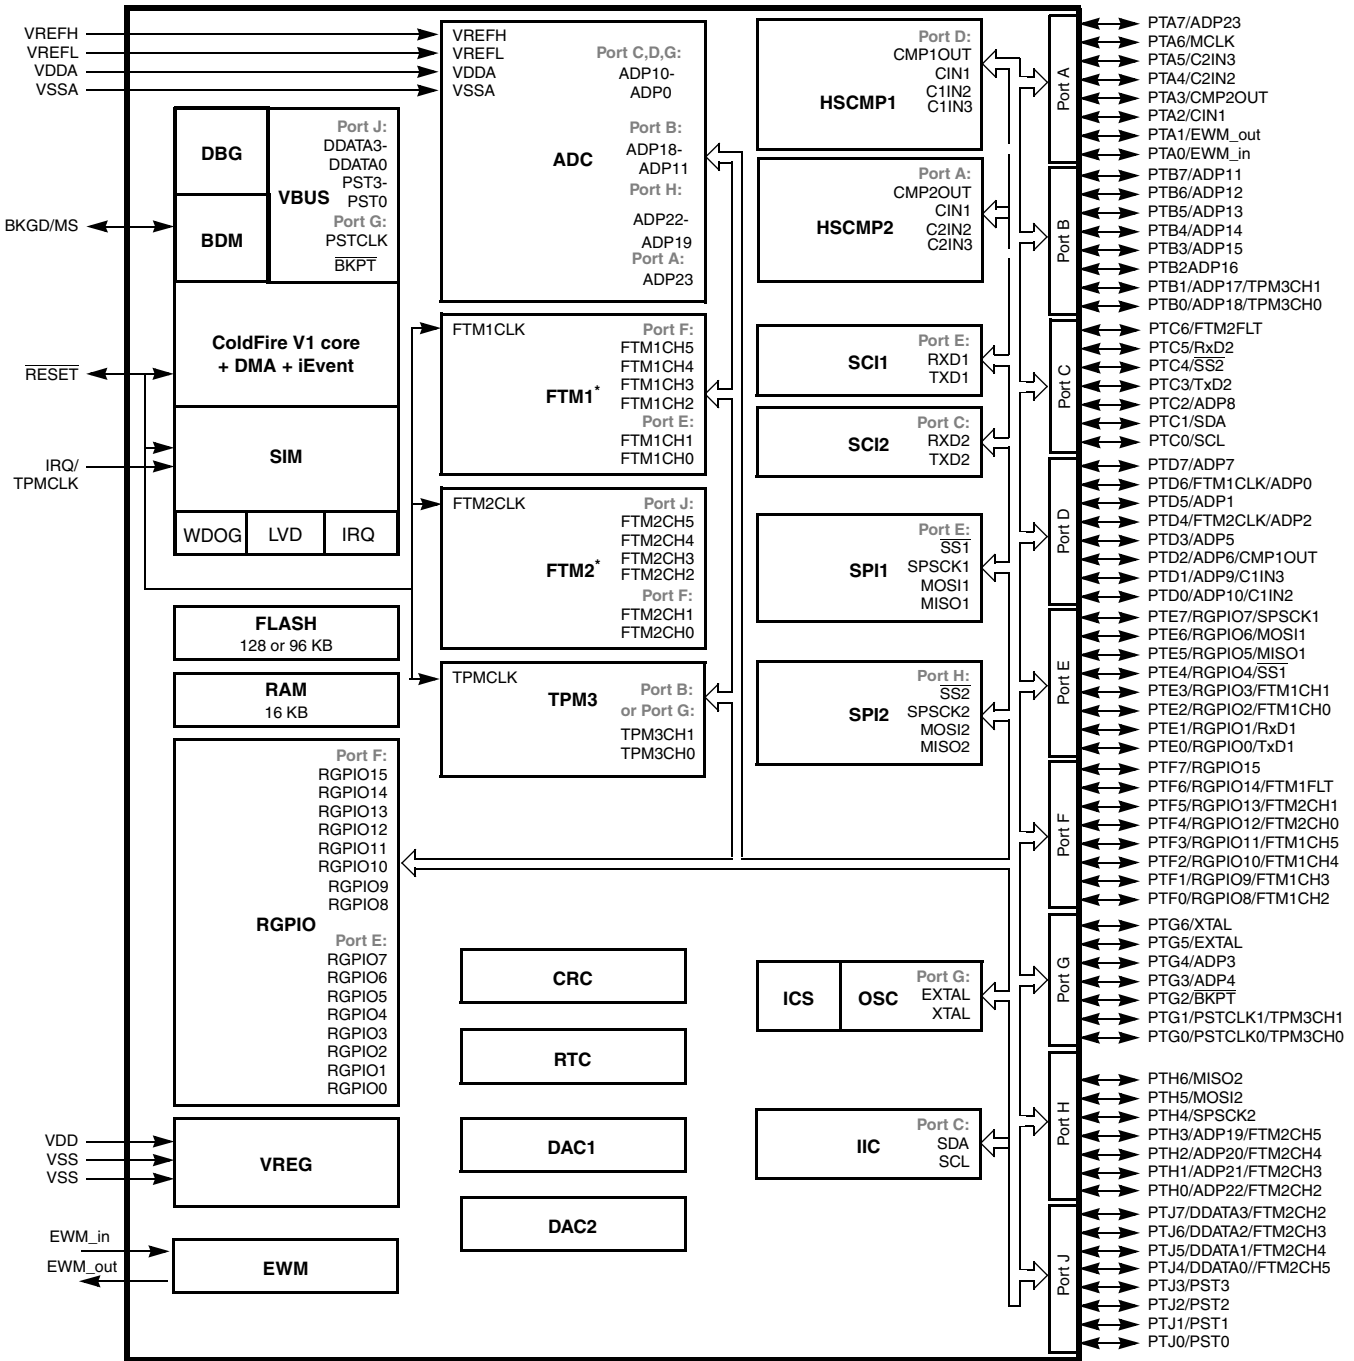

Figure 1. MCF51AG128 Series MCUs Block Diagram

## 1.3 Features

Table 2 describes the functional units of the MCF51AG128 series.

**Table 2. MCF51AG128 Series Functional Units**

Functional Unit	Function
CF1Core (V1 ColdFire core)	Executes programs and interrupt handlers
BDM (background debug module)	Provides single pin debugging interface (part of the V1 ColdFire core)
DBG (debug)	Provides debugging and emulation capabilities (part of the V1 ColdFire core)
VBUS (debug visibility bus)	Allows for real-time program traces (part of the V1 ColdFire core)
SIM (system integration module)	Controls resets and chip level interfaces between modules
Flash (flash memory)	Provides storage for program code, constants, and variables
RAM (random-access memory)	Provides storage for program variables
RGPIO (rapid general-purpose input/output)	Allows for I/O port access at CPU clock speeds
VREG (voltage regulator)	Controls power management across the device
LVD (low-voltage detect)	Monitors internal and external supply voltage levels, and generates a reset or interrupt when the voltages are too low
CF1_INTC (interrupt controller)	Controls and prioritizes all device interrupts
ADC (analog-to-digital converter)	Measures analog voltages at up to 12 bits of resolution
FTM1, FTM2 (flexible timer/pulse-width modulators)	Provide a variety of timing-based features
TPM3 (timer/pulse-width modulator)	Provides a variety of timing-based features
CRC (cyclic redundancy check)	Accelerates computation of CRC values for ranges of memory
HSCMP1, HSCMP2 (analog comparators)	Compare two analog inputs
DAC1, DAC2 (digital-to-analog converter)	Provide programmable voltage reference for HSCMPx
IIC (inter-integrated circuit)	Supports standard IIC communications protocol
ICS (internal clock source)	Provides clocking options for the device, including a frequency-locked loop (FLL) for multiplying slower reference clock sources
OSC (crystal oscillator)	Allows a crystal or ceramic resonator to be used as the system clock source or reference clock for the FLL
SCI1, SCI2 (serial communications interfaces)	Serial communications UARTs capable of supporting RS-232 and LIN protocols
SPI1, SPI2 (8/16-bit serial peripheral interfaces)	Provide 8/16-bit 4-pin synchronous serial interface
DMA	Provides the means to directly transfer data between system memory and I/O peripherals
iEvent	Highly programmable module for creating combinational boolean outputs for use as interrupt requests, DMA transfer requests, or hardware triggers
EWM (External Watchdog Monitor)	Additional watchdog system to help reset external circuits

**Table 2. MCF51AG128 Series Functional Units (continued)**

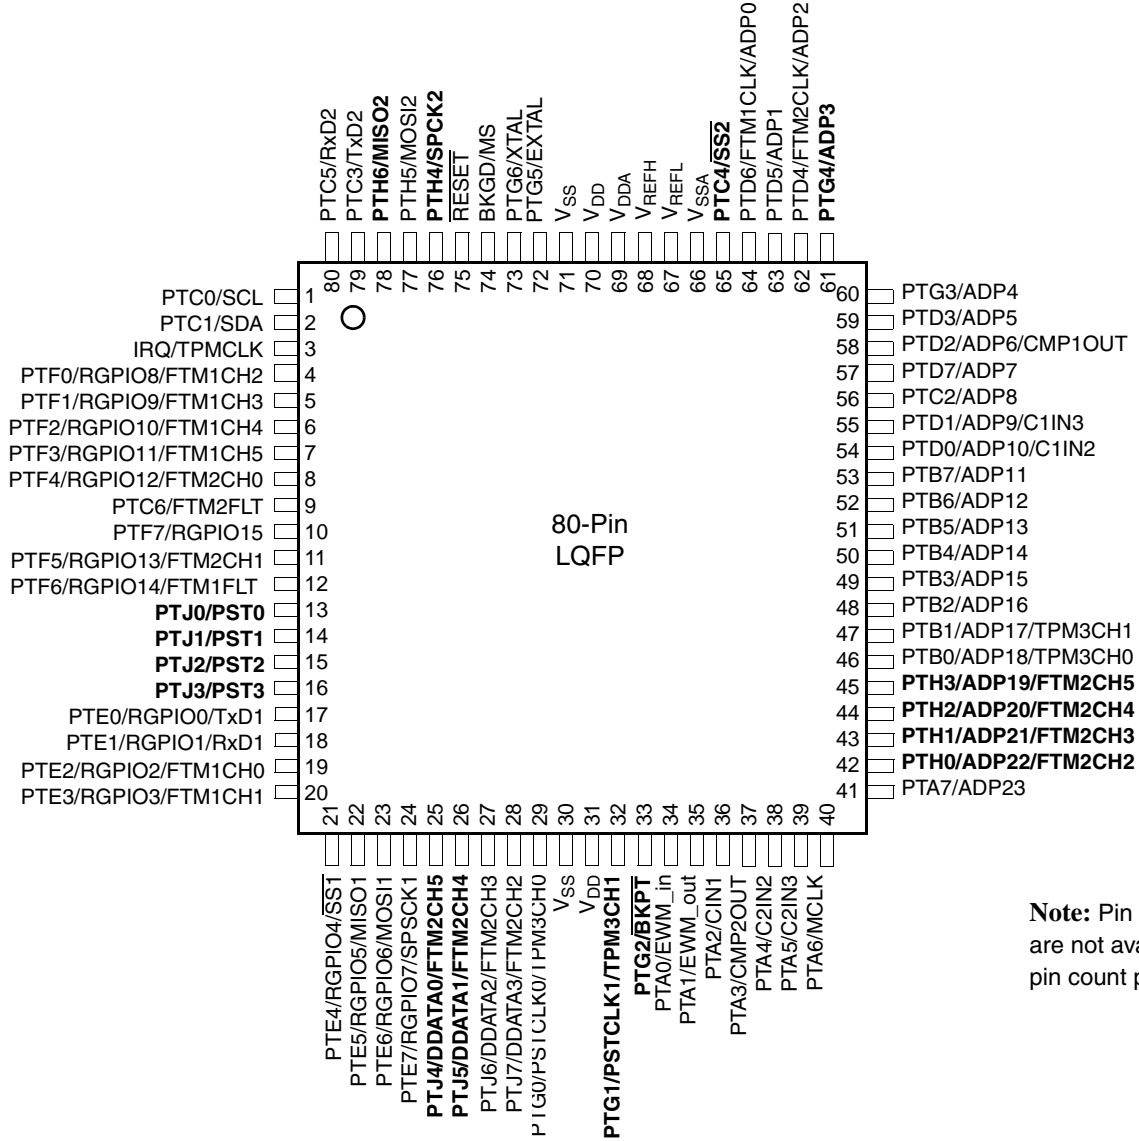

Functional Unit	Function
WDOG (Watchdog timer)	keeps a watch on the system functioning and resets it in case of its failure
RTC (Real Time Counter)	Provides a constant time-base with optional interrupt

# 1.4 Pin Assignments

This section describes the pin assignments for the available packages.

Figure 2 shows the pinout of the 80-pin LQFP.

**Note:** Pin names in bold are not available in lower pin count packages.

Figure 2. 80-Pin LQFP

Figure 3 shows the pinout of the 64-pin LQFP and QFP.

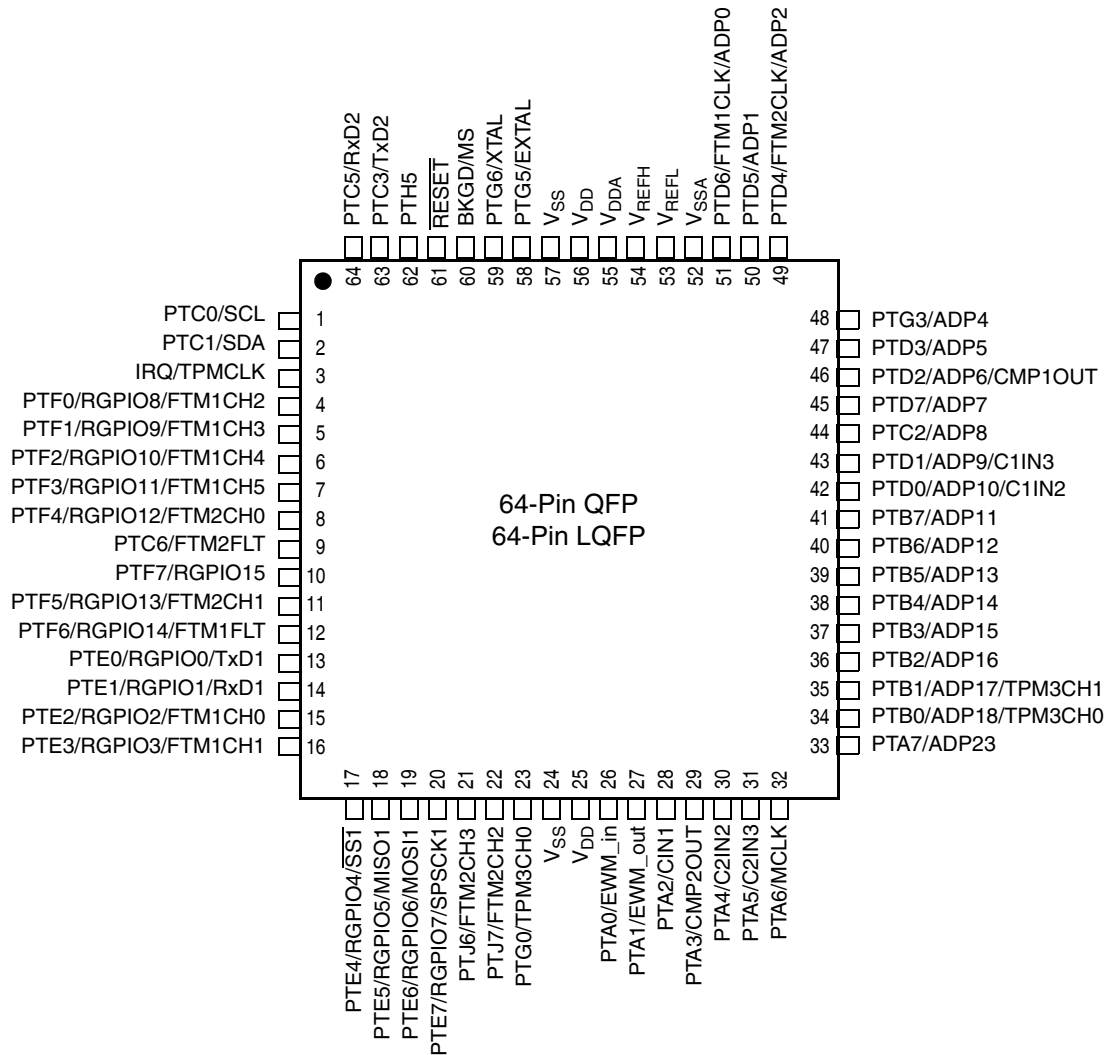

Figure 3. 64-Pin QFP and LQFP

Figure 4 shows the pinout of the 48-pin LQFP.

Figure 4. 48-Pin LQFP

Table 3 shows the package pin assignments.

**Table 3. Pin Availability by Package Pin-Count**

Pin Number			Lowest <-- Priority --> Highest		
80	64	48	Port Pin	Alt 1	Alt 2
1	1	—	PTC0	SCL	
2	2	—	PTC1	SDA	
3	3	1	IRQ	TPMCLK <sup>1</sup>

59	47	—	PTD3	ADP5	
60	48	—	PTG3	ADP4	
61	—	—	PTG4	ADP3	
62	49	—	PTD4	FTM2CLK	ADP2
63	50	—	PTD5	ADP1	
64	51	37	PTD6	FTM1CLK	ADP0
65	—	—	PTC4	$\overline{SS2}$	
66	52	38	V <sub>SSA</sub>		
67	53	38	V <sub>REFL</sub>		
68	54	39	V <sub>REFH</sub>		
69	55	39	V <sub>DDA</sub>		
70	56	40	V <sub>DD</sub>		
71	57	41	V <sub>SS</sub>		
72	58	42	PTG5	EXTAL	
73	59	43	PTG6	XTAL	
74	60	44	BKGD	MS	
75	61	45	$\overline{RESET}$		
76	—	—	PTH4	SPSCK2	
77	62	46	PTH5	MOSI2	
78	—	—	PTH6	MISO2	
79	63	47	PTC3	TxD2	
80	64	48	PTC5	RxD2	

<sup>1</sup> TPMCLK, FTM1CLK, and FTM2CLK options are configured via software; out of reset, FTM1CLK, FTM2CLK, and TPMCLK are available to FTM1, FTM2, and TPM3 respectively.

## 2 Preliminary Electrical Characteristics

This section contains electrical specification tables and reference timing diagrams for the MCF51AG128 series MCUs, including detailed information on power considerations, DC/AC electrical characteristics, and AC timing specifications.

The electrical specifications are preliminary and are from previous designs or design simulations. These specifications may not be fully tested or guaranteed at this early stage of the product life cycle. These specifications will, however, be met for production silicon. Finalized specifications will be published after complete characterization and device qualifications have been completed.

### NOTE

The parameters specified in this data sheet supersede any values found in the module specifications.

### 2.1 Parameter Classification

The electrical parameters shown in this supplement are guaranteed by various methods. To give the customer a better understanding the following classification is used and the parameters are tagged accordingly in the tables where appropriate:

**Table 4. Parameter Classifications**

<b>P</b>	Those parameters are guaranteed during production testing on each individual device.
<b>C</b>	Those parameters are achieved by the design characterization by measuring a statistically relevant sample size across process variations.
<b>T</b>	Those parameters are achieved by design characterization on a small sample size from typical devices under typical conditions unless otherwise noted. All values shown in the typical column are within this category.
<b>D</b>	Those parameters are derived mainly from simulations.

### NOTE

The classification is shown in the column labeled “C” in the parameter tables where appropriate.

### 2.2 Absolute Maximum Ratings

Absolute maximum ratings are stress ratings only, and functional operation at the maxima is not guaranteed. Stress beyond the limits specified in [Table 5](#) may affect device reliability or cause permanent damage to the device. For functional operating conditions, refer to the remaining tables in this section.

This device contains circuitry protecting against damage due to high static voltage or electrical fields; however, it is advised that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (for instance, either  $V_{SS}$  or  $V_{DD}$ ).

**Table 5. Absolute Maximum Ratings**

Rating	Symbol	Value	Unit
Supply voltage	$V_{DD}$	-0.3 to 5.8	V
Input voltage	$V_{In}$	-0.3 to $V_{DD} + 0.3$	V
Instantaneous maximum current Single pin limit (applies to all port pins) <sup>1, 2, 3</sup>	$I_D$	±25	mA
Maximum current into $V_{DD}$	$I_{DD}$	120	mA
Storage temperature	$T_{stg}$	-55 to 150	°C

<sup>1</sup> Input must be current limited to the value specified. To determine the value of the required current-limiting resistor, calculate resistance values for positive ( $V_{DD}$ ) and negative ( $V_{SS}$ ) clamp voltages, then use the larger of the two resistance values.

<sup>2</sup> All functional non-supply pins are internally clamped to  $V_{SS}$  and  $V_{DD}$ .

<sup>3</sup> Power supply must maintain regulation within operating  $V_{DD}$  range during instantaneous and operating maximum current conditions. If positive injection current ( $V_{In} > V_{DD}$ ) is greater than  $I_{DD}$ , the injection current may flow out of  $V_{DD}$  and could result in external power supply going out of regulation. Ensure external  $V_{DD}$  load will shunt current greater than maximum injection current. This will be the greatest risk when the MCU is not consuming power. Examples are: if no system clock is present, or if the clock rate is very low which would reduce overall power consumption.

## 2.3 Thermal Characteristics

This section provides information about operating temperature range, power dissipation, and package thermal resistance. Power dissipation on I/O pins is usually small compared to the power dissipation in on-chip logic and it is user-determined rather than being controlled by the MCU design. To take  $P_{I/O}$  into account in power calculations, determine the difference between actual pin voltage and  $V_{SS}$  or  $V_{DD}$  and multiply by the pin current for each I/O pin. Except in cases of unusually high pin current (heavy loads), the difference between pin voltage and  $V_{SS}$  or  $V_{DD}$  is very small.

**Table 6. Thermal Characteristics**

Rating	Symbol	Value	Unit
Operating temperature range (packaged)	$T_A$	-40 to 105	°C
Maximum junction temperature	$T_J$	150	°C
Thermal resistance <sup>1,2,3,4</sup>			
80-pin LQFP	1s	56	°C/W
	2s2p	45	
64-pin QFP	1s	54	
	2s2p	41	
64-pin LQFP	1s	67	
	2s2p	49	
48-pin LQFP	1s	69	
	2s2p	51	

## Preliminary Electrical Characteristics

- <sup>1</sup> Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance.
- <sup>2</sup> Junction to Ambient Natural Convection
- <sup>3</sup> 1s — Single layer board, one signal layer
- <sup>4</sup> 2s2p — Four layer board, 2 signal and 2 power layers

The average chip-junction temperature ( $T_J$ ) in °C can be obtained from:

$$T_J = T_A + (P_D \times \theta_{JA}) \quad \text{Eqn. 1}$$

where:

$T_A$  = Ambient temperature, °C

$\theta_{JA}$  = Package thermal resistance, junction-to-ambient, °C/W

$P_D = P_{int} + P_{I/O}$

$P_{int} = I_{DD} \times V_{DD}$ , Watts — chip internal power

$P_{I/O}$  = Power dissipation on input and output pins — user determined

For most applications,  $P_{I/O} \ll P_{int}$  and can be neglected. An approximate relationship between  $P_D$  and  $T_J$  (if  $P_{I/O}$  is neglected) is:

$$P_D = K \div (T_J + 273 \text{ °C}) \quad \text{Eqn. 2}$$

Solving [Equation 1](#) and [Equation 2](#) for K gives:

$$K = P_D \times (T_A + 273 \text{ °C}) + \theta_{JA} \times (P_D)^2 \quad \text{Eqn. 3}$$

where K is a constant pertaining to the particular part. K can be determined from [Equation 3](#) by measuring  $P_D$  (at equilibrium) for a known  $T_A$ . Using this value of K, the values of  $P_D$  and  $T_J$  can be obtained by solving [Equation 1](#) and [Equation 2](#) iteratively for any value of  $T_A$ .

## 2.4 Electrostatic Discharge (ESD) Protection Characteristics

Although damage from static discharge is much less common on these devices than on early CMOS circuits, normal handling precautions should be used to avoid exposure to static discharge. Qualification tests are performed to ensure that these devices can withstand exposure to reasonable levels of static without suffering any permanent damage.

All ESD testing is in conformity with CDF-AEC-Q00 Stress Test Qualification for Automotive Grade Integrated Circuits. (<http://www.aecouncil.com/>) This device was qualified to AEC-Q100 Rev E.

A device is considered to have failed if, after exposure to ESD pulses, the device no longer meets the device specification requirements. Complete dc parametric and functional testing is performed per the applicable device specification at room temperature followed by hot temperature, unless specified otherwise in the device specification.

**Table 7. ESD and Latch-up Test Conditions**

Model	Description	Symbol	Value	Unit
Human Body	Series Resistance	R1	1500	Ω
	Storage Capacitance	C	100	pF
	Number of Pulse per pin	—	3	—

**Table 7. ESD and Latch-up Test Conditions (continued)**

Model	Description	Symbol	Value	Unit
Latch-up	Minimum input voltage limit	—	-2.5	V
	Maximum input voltage limit	—	7.5	V

**Table 8. ESD and Latch-Up Protection Characteristics**

Num	Rating	Symbol	Min	Max	Unit
1	Human Body Model (HBM)	$V_{HBM}$	±2000	—	V
2	Charge Device Model (CDM)	$V_{CDM}$	±500	—	V
3	Latch-up Current at $T_A = 85^\circ\text{C}$	$I_{LAT}$	±100	—	mA

## 2.5 DC Characteristics

This section includes information about power supply requirements, I/O pin characteristics, and power supply current in various operating modes.

**Table 9. DC Characteristics**

Num	C	Parameter	Symbol	Min	Typical <sup>1</sup>	Max	Unit
1	—	Operating voltage		2.7	—	5.5	V
2	P	Output high voltage — Low Drive (PTxDSn = 0) 5 V, $I_{Load} = -5$ mA 3 V, $I_{Load} = -1.5$ mA 5V, $I_{Load} = -3$ mA, PTC0 and PTC1 3V, $I_{Load} = -1.5$ mA, PTC0 and PTC1	$V_{OH}$	$V_{DD} - 1.5$	—	—	V

				$V_{DD}$ rising	4.3	4.4	4.5	
20	P	Low-voltage warning threshold low range 1	$V_{LVW1}$	$V_{DD}$ falling	2.84	2.92	3.00	V
				$V_{DD}$ rising	2.90	2.98	3.06	
21	P	Low-voltage warning threshold — low range 0	$V_{LVW0}$	$V_{DD}$ falling	2.66	2.74	2.82	V
				$V_{DD}$ rising	2.72	2.80	2.88	
22	T	Low-voltage inhibit reset/recover hysteresis	$V_{hys}$	5 V	—	100	—	mV
				3 V	—	60	—	
23	D	RAM retention voltage	$V_{RAM}$	—	0.6	1.0	V	
24	D	DC injection current <sup>5 6 7 8</sup> (single pin limit)	$I_{IC}$	$V_{IN} > V_{DD}$	0	—	2	mA
				$V_{IN} < V_{SS}$	0	—	-0.2	
		DC injection current (Total MCU limit, includes sum of all stressed pins)		$V_{IN} > V_{DD}$	0	—	25	mA
				$V_{IN} < V_{SS}$	0	—	-5	

- <sup>1</sup> Typical values are based on characterization data at 25°C unless otherwise stated.
- <sup>2</sup> Measured with  $V_{In} = V_{DD}$  or  $V_{SS}$ .
- <sup>3</sup> Measured with  $V_{In} = V_{SS}$ .
- <sup>4</sup> Measured with  $V_{In} = V_{DD}$ .
- <sup>5</sup> Power supply must maintain regulation within operating  $V_{DD}$  range during instantaneous and operating maximum current conditions. If positive injection current ( $V_{In} > V_{DD}$ ) is greater than  $I_{DD}$ , the injection current may flow out of  $V_{DD}$  and could result in external power supply going out of regulation. Ensure external  $V_{DD}$  load will shunt current greater than maximum injection current. This will be the greatest risk when the MCU is not consuming power. Examples are: if no system clock is present, or if clock rate is very low (which would reduce overall power consumption).
- <sup>6</sup> All functional non-supply pins are internally clamped to  $V_{SS}$  and  $V_{DD}$ .
- <sup>7</sup> Input must be current limited to the value specified. To determine the value of the required current-limiting resistor, calculate resistance values for positive and negative clamp voltages, then use the larger of the two values.
- <sup>8</sup> The  $\overline{\text{RESET}}$  pin does not have a clamp diode to  $V_{DD}$ . Do not drive this pin above  $V_{DD}$ .

				3	300	—	nA	
17	C	Adder to stop3 for oscillator enabled <sup>6</sup> (ERCLKEN = 1 and EREFSTEN = 1)	S3I <sub>DDOSC</sub>	5, 3	5	—	μA	

<sup>1</sup> Typicals are measured at 25 °C.

<sup>2</sup> Values given here are preliminary estimates prior to completing characterization.

<sup>3</sup> Code run from flash, FEI mode, and does not include any dc loads on port pins. Bus CLK= (CPU CLK/2)

<sup>4</sup> GPIO filters are working on LPO clock.

<sup>5</sup> Most customers are expected to use auto-wakeup from stop2 or stop3 instead of the higher current wait mode.

<sup>6</sup> Values given under the following conditions: low range operation (RANGE = 0), low power mode (HGO = 0).

**Figure 9. Run Current at Different Conditions**

## 2.7 High Speed Comparator (HSCMP) Electricals

Table 11. HSCMP Electrical Specifications

Num	C	Rating	Symbol	Min	Typical	Max	Unit
1	—	Supply voltage	$V_{DD}$	2.7	—	5.5	V
2	T	Supply current, high speed mode (EN = 1, PMODE = 1)	$I_{DDAHS}$	—	200	—	$\mu\text{A}$
3	T	Supply current, low speed mode (EN = 1, PMODE = 0)	$I_{DDALS}$	—	20	—	$\mu\text{A}$
4	—	Analog input voltage	$V_{AIN}$	$V_{SS} - 0.3$	—	$V_{DD}$	V

6	T	Square wave input clock frequency (EREFS = 0, ERCLKEN = 1)	$f_{extal}$	0.03125 0 0	— — —	50.33 50.33 50.33	MHz
		FEE mode <sup>2</sup>					
		FBE mode <sup>2</sup>					
		FBELP mode					

<sup>1</sup> Data in Typical column was characterized at 5.0 V, 25 °C or is typical recommended value.

## Preliminary Electrical Characteristics

- <sup>2</sup> When MCG is configured for FEE or FBE mode, input clock source must be divisible using RDIV to within the range of 31.25 kHz to 39.0625 kHz.
- <sup>3</sup> This parameter is characterized and not tested on each device. Proper PC board layout procedures must be followed to achieve specifications.
- <sup>4</sup> 4 MHz crystal

## 2.11 ICS Specifications

**Table 15. ICS Frequency Specifications (Temperature Range = –40 to 105 °C Ambient)**

Num	C	Rating	Symbol	Min	Typical <sup>1</sup>	Max	Unit	
1	C	Internal reference frequency - factory trimmed at V <sub>DD</sub> = 5 V and temperature = 25 °C	f <sub>int_ft</sub>	—	32.768	—	kHz	
2	C	Average internal reference frequency – untrimmed	f <sub>int_ut</sub>	31.25	—	39.06	kHz	
3	T	Internal reference startup time	t <sub>irefst</sub>	—	60	100	μs	
4	C	DCO output frequency range - untrimmed <sup>2</sup>	f <sub>dco_ut</sub>	Low range (DRS = 00)	16	—	20	MHz
	C			Mid range (DRS = 01)	32	—	40	
	C			High range (DRS = 10)	48	—	60	
5	P	DCO output frequency <sup>2</sup> Reference = 32768Hz and DMX32 = 1	f <sub>dco_DM32</sub>	Low range (DRS = 00)	—	16.82	—	MHz
	P			Mid range (DRS = 01)	—	33.69	—	
	P			High range (DRS = 10)	—	50.48	—	
6	D	Resolution of trimmed DCO output frequency at fixed voltage and temperature (using FTRIM)	Δf <sub>dco_res_t</sub>	—	±0.1	±0.2	%f <sub>dco</sub>	
7	D	Resolution of trimmed DCO output frequency at fixed voltage and temperature (not using FTRIM)	Δf <sub>dco_res_t</sub>	—	±0.2	±0.4	%f <sub>dco</sub>	
8	D	Total deviation of trimmed DCO output frequency over full voltage and temperature range	Δf <sub>dco_t</sub>	—	0.5 –1.0	±2	%f <sub>dco</sub>	
9	D	Total deviation of trimmed DCO output frequency over fixed voltage and temperature range of 0 –70 °C	Δf <sub>dco_t</sub>	—	±0.5	±1	%f <sub>dco</sub>	

**Table 15. ICS Frequency Specifications (continued)(Temperature Range = –40 to 105 °C Ambient)**

Num	C	Rating	Symbol	Min	Typical <sup>1</sup>	Max	Unit
10	D	FLL acquisition time <sup>3</sup>	$t_{fill\_acquire}$	—	—	1	ms
11	D	Long term Jitter of DCO output clock (averaged over 2ms interval) <sup>4</sup>	$C_{Jitter}$	—	0.02	0.2	% $f_{dco}$
12	D	Loss of external clock minimum freq. (RANGE = 0) <ul style="list-style-type: none"> <li>• ext. clock freq: above <math>(3/5)f_{int}</math>, never reset</li> <li>• ext. clock freq: between <math>(2/5)f_{int}</math> and <math>(3/5)f_{int}</math>, maybe reset (phase dependency)</li> <li>• ext. clock freq: below <math>(2/5)f_{int}</math>, always reset</li> </ul>	$f_{loc\_low}$	$(3/5) \times f_{int}$	—	—	kHz
13	D	Loss of external clock minimum freq. (RANGE = 1) <ul style="list-style-type: none"> <li>• ext. clock freq: above <math>(16/5)f_{int}</math>, never reset</li> <li>• ext. clock freq: between <math>(15/5)f_{int}</math> and <math>(16/5)f_{int}</math>, maybe reset (phase dependency)</li> <li>• ext. clock freq: below <math>(15/5)f_{int}</math>, always reset</li> </ul>	$f_{loc\_high}$	$(16/5) \times f_{int}$	—	—	kHz

<sup>1</sup> Data in Typical column was characterized at 3.0 V, 25 °C or is typical recommended value

<sup>2</sup> The resulting bus clock frequency should not exceed the maximum specified bus clock frequency of the device.

<sup>3</sup> This specification applies to any time the FLL reference source or reference divider is changed, trim value changed or changing from FLL disabled (BLPE, BLPI) to FLL enabled (FEI, FEE, FBE, FBI). If a crystal/resonator is being used as the reference, this specification assumes it is already running.

<sup>4</sup> Jitter is the average deviation from the programmed frequency measured over the specified interval at maximum  $f_{BUS}$ . Measurements are made with the device powered by filtered supplies and clocked by a stable external clock signal. Noise injected into the FLL circuitry by  $V_{DD}$  and  $V_{SS}$  and variation in crystal oscillator frequency increase the  $C_{Jitter}$  percentage for a given interval.

## 2.12 AC Characteristics

This section describes ac timing characteristics for each peripheral system.

### 2.12.1 Control Timing

Table 16. Control Timing

Num	C	Parameter	Symbol	Min	Typ <sup>1</sup>	Max	Unit
1	D	Bus frequency ( $t_{cyc} = 1/f_{Bus}$ )	$f_{Bus}$	dc	—	24	MHz
2	D	Internal low-power oscillator period	$t_{LPO}$	800	—	1500	$\mu$ s
3	D	External reset pulse width <sup>2</sup> ( $t_{cyc} = 1/f_{Self\_reset}$ )	$t_{extrst}$	100	—	—	ns
4	D	Reset low drive	$t_{rstdrv}$	$66 \times t_{cyc}$	—	—	ns
5	D	Active background debug mode latch setup time	$t_{MSSU}$	500	—	—	ns
6	D	Active background debug mode latch hold time	$t_{MSH}$	100	—	—	ns
7	D	IRQ pulse width  Asynchronous path <sup>2</sup> Synchronous path <sup>3</sup>	$t_{ILIH}, t_{IHIL}$	100 $1.5 \times t_{cyc}$	—	—	ns
8		Port rise and fall time (load = 30 pF for SPI, rest 50 pF) <sup>4</sup> Slew rate control disabled (PTxSE = 0) High drive Slew rate control enabled (PTxSE = 1) High drive Slew rate control disabled (PTxSE = 0) Low drive Slew rate control enabled (PTxSE = 1) Low drive	$t_{Rise}, t_{Fall}$	— —	11 35 40 75		ns

<sup>1</sup> Typical values are based on characterization data at  $V_{DD} = 5.0$  V, 25 °C unless otherwise stated.

<sup>2</sup> This is the shortest pulse that is guaranteed to be recognized as a  $\overline{RESET}$  pin request. Shorter pulses are not guaranteed to override reset requests from internal sources.

<sup>3</sup> This is the minimum pulse width that is guaranteed to pass through the pin synchronization circuitry. Shorter pulses may or may not be recognized. In stop mode, the synchronizer is bypassed so shorter pulses can be recognized in that case.

<sup>4</sup> Timing is shown with respect to 20%  $V_{DD}$  and 80%  $V_{DD}$  levels. Temperature range  $-40^{\circ}$ C to  $105^{\circ}$ C.

Figure 11. Reset Timing

Figure 12. IRQ/KBIPx Timing

### 2.12.2 Timer (TPM/FTM) Module Timing

Synchronizer circuits determine the shortest input pulses that can be recognized or the fastest clock that can be used as the optional external source to the timer counter. These synchronizers operate from the current bus rate clock.

Table 17. TPM/FTM Input Timing

NUM	C	Function	Symbol	Min	Max	Unit
1	—	External clock frequency	$f_{TPMext}$	DC	$f_{Bus}/4$	MHz
2	—	External clock period	$t_{TPMext}$	4	—	$t_{cyc}$
3	D	External clock high time	$t_{clkh}$	1.5	—	$t_{cyc}$
4	D	External clock low time	$t_{clkl}$	1.5	—	$t_{cyc}$
5	D	Input capture pulse width	$t_{ICPW}$	1.5	—	$t_{cyc}$

Figure 13. Timer External Clock

Figure 14. Timer Input Capture Pulse

### 2.12.3 SPI Characteristics

Table 18 and Figure 15 through Figure 18 describe the timing requirements for the SPI system.

**Table 18. SPI Timing Characteristics**

No.	C	Function	Symbol	Min	Max	Unit
—	D	Operating frequency Master Slave	$f_{op}$	$f_{Bus}/2048$ 0	$f_{Bus}/2$ $f_{Bus}/4$	Hz
1	D	SPSCK period Master Slave	$t_{SPSCK}$	2 4	2048 —	$t_{cyc}$ $t_{cyc}$
2	D	Enable lead time Master Slave	$t_{Lead}$	1/2 1	— —	$t_{SPSCK}$ $t_{cyc}$
3	D	Enable lag time Master Slave	$t_{Lag}$	1/2 1	— —	$t_{SPSCK}$ $t_{cyc}$
4	D	Clock (SPSCK) high or low time Master Slave	$t_{WSPSCK}$	$t_{cyc} - 30$ $t_{cyc} - 30$	$1024 t_{cyc}$ —	ns ns
5	D	Data setup time (inputs) Master Slave	$t_{SU}$	30 30	— —	ns ns
6	D	Data hold time (inputs) Master Slave	$t_{HI}$	10 10	— —	ns ns
7	D	Slave access time	$t_a$	—	—	$t_{cyc}$
8	D	Slave MISO disable time	$t_{dis}$	—	—	$t_{cyc}$
9	D	Data valid time ( maximum delay after SPCLK edge to Data output) Master Slave	$t_V^1$	— —	25 70	ns ns
10	D	Data hold time ( minimum delay after SPCLK edge to Data output) Master Slave	$t_{HO}^1$	10 10	— —	ns ns

<sup>1</sup> SPI Output Load = 30 pf

NOTES:

1.  $\overline{SS}$  output mode (DDS7 = 1, SSOE = 1).
2. LSBF = 0. For LSBF = 1, bit order is LSB, bit 1, ..., bit 6, MSB.

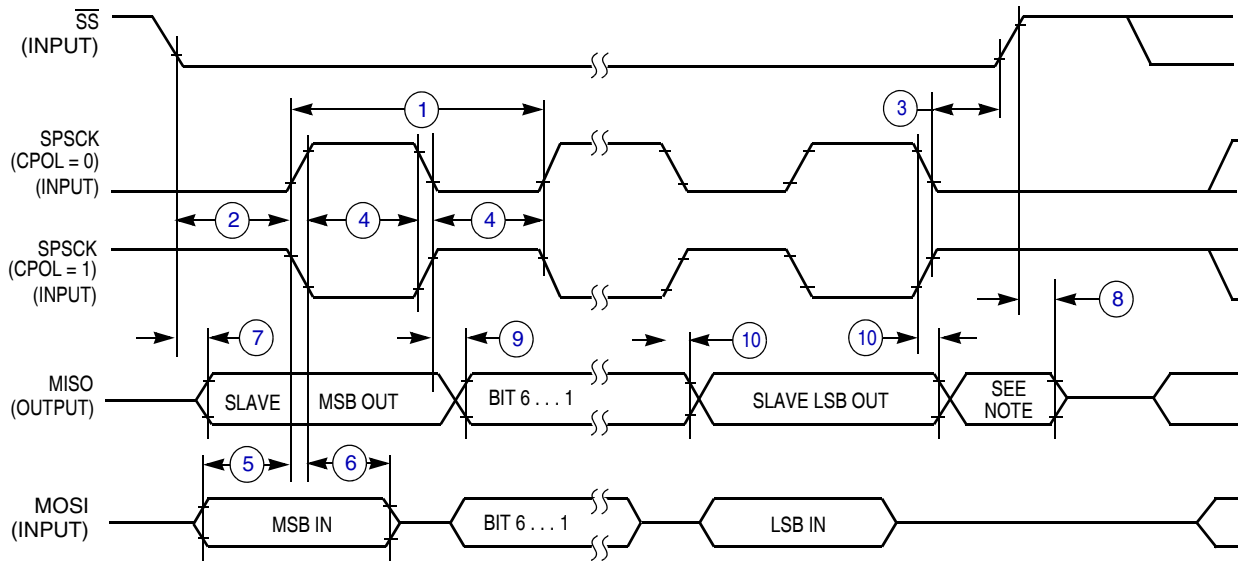

**Figure 15. SPI Master Timing (CPHA = 0)**

NOTES:

1.  $\overline{SS}$  output mode (DDS7 = 1, SSOE = 1).
2. LSBF = 0. For LSBF = 1, bit order is LSB, bit 1, ..., bit 6, MSB.

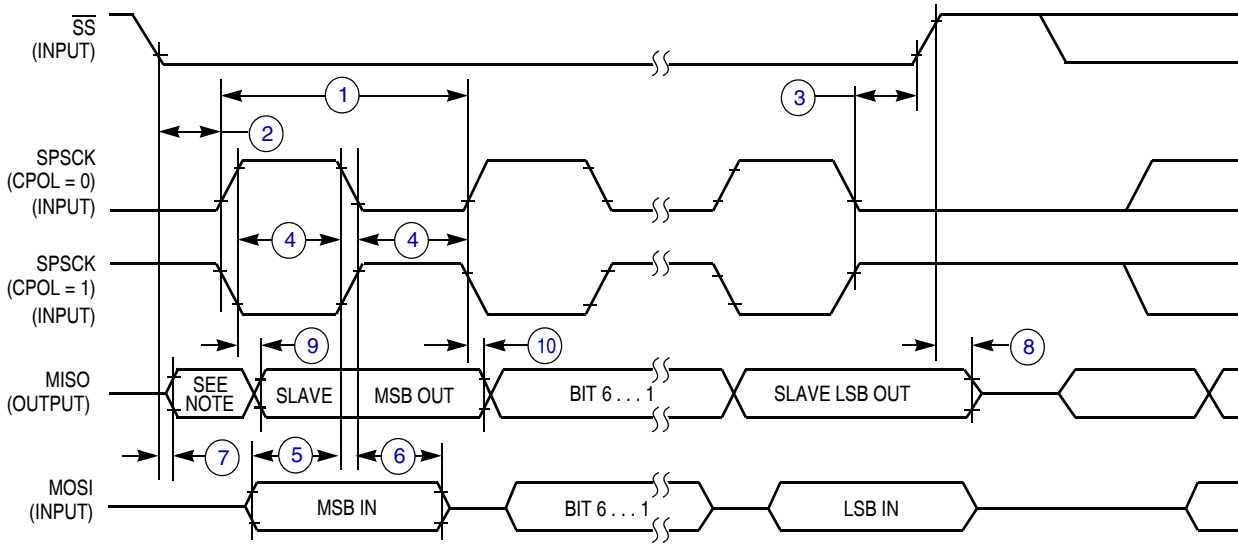

**Figure 16. SPI Master Timing (CPHA = 1)**

NOTE:

1. Not defined but normally MSB of character just received

**Figure 17. SPI Slave Timing (CPHA = 0)**

NOTE:

1. Not defined but normally LSB of character just received

**Figure 18. SPI Slave Timing (CPHA = 1)**

## 2.13 Flash Specifications

This section provides details about program/erase times and program-erase endurance for the Flash memory.

Program and erase operations do not require any special power sources other than the normal  $V_{DD}$  supply. For more detailed information about program/erase operations, see *MCF51AG128 Reference Manual*.

Table 19. Flash Characteristics

Num	C	Characteristic	Symbol	Min	Typical <sup>1</sup>	Max	Unit
1	—	Supply voltage for program/erase	$V_{\text{prog/erase}}$	2.7		5.5	V
2	—	Supply voltage for read operation	$V_{\text{Read}}$	2.7		5.5	V
3	—	Internal FCLK frequency <sup>2</sup>	$f_{\text{FCLK}}$	150		200	kHz
4	—	Internal FCLK period (1/FCLK)	$t_{\text{Fcyt}}$	5		6.67	$\mu\text{s}$
5	—	Byte program time (random location) <sup>2</sup>	$t_{\text{prog}}$	9			$t_{\text{Fcyt}}$
6	—	Byte program time (burst mode) <sup>2</sup>	$t_{\text{Burst}}$	4			$t_{\text{Fcyt}}$
7	—	Page erase time <sup>3</sup>	$t_{\text{Page}}$	4000			$t_{\text{Fcyt}}$
8	—	Mass erase time <sup>2</sup>	$t_{\text{Mass}}$	20,000			$t_{\text{Fcyt}}$
9	C	Program/erase endurance <sup>4</sup> $T_L$ to $T_H = -40\text{ }^\circ\text{C}$ to $105\text{ }^\circ\text{C}$ $T = 25\text{ }^\circ\text{C}$		10,000 —	— 100,000	— —	cycles
10	C	Data retention <sup>5</sup>	$t_{\text{D\_ret}}$	15	100	—	years

<sup>1</sup> Typical values are based on characterization data at  $V_{\text{DD}} = 5.0\text{ V}$ ,  $25\text{ }^\circ\text{C}$  unless otherwise stated.

<sup>2</sup> The frequency of this clock is controlled by a software setting.

<sup>3</sup> These values are hardware state machine controlled. User code does not need to count cycles. This information supplied for calculating approximate time to program and erase.

<sup>4</sup> **Typical endurance for flash** was evaluated for this product family on the HC9S12Dx64. For additional information on how Freescale Semiconductor defines typical endurance, please refer to Engineering Bulletin EB619/D, *Typical Endurance for Nonvolatile Memory*.

<sup>5</sup> **Typical data retention** values are based on intrinsic capability of the technology measured at high temperature and de-rated to  $25\text{ }^\circ\text{C}$  using the Arrhenius equation. For additional information on how Freescale Semiconductor defines typical data retention, please refer to Engineering Bulletin EB618/D, *Typical Data Retention for Nonvolatile Memory*.

## 2.14 EMC Performance

Electromagnetic compatibility (EMC) performance is highly dependant on the environment in which the MCU resides. Board design and layout, circuit topology choices, location and characteristics of external components as well as MCU software operation all play a significant role in EMC performance. The system designer should consult Freescale applications notes such as AN2321, AN1050, AN1263, AN2764, and AN1259 for advice and guidance specifically targeted at optimizing EMC performance.

### 2.14.1 Radiated Emissions

Microcontroller radiated RF emissions are measured from 150 kHz to 1 GHz using the TEM/GTEM Cell method in accordance with the IEC 61967-2 and SAE J1752/3 standards. The measurement is performed with the microcontroller installed on a custom EMC evaluation board while running specialized EMC test software. The radiated emissions from the microcontroller are measured in a TEM cell in two package orientations (North and East). For more detailed information concerning the evaluation results, conditions and setup, please refer to the EMC Evaluation Report for this device.

### 3 Ordering Information

This section contains ordering information for MCF51AG128 devices.

**Table 20. Orderable Part Number Summary**

Freescale Part Number	Description	Flash / SRAM (KB)	Package	Temperature
MCF51AG128VLK	MCF51AG128 ColdFire Microcontroller	128 / 16	80 LQFP	-40°C to 105°C
MCF51AG128VLH	MCF51AG128 ColdFire Microcontroller	128 / 16	64 LQFP	-40°C to 105°C
MCF51AG128VQH	MCF51AG128 ColdFire Microcontroller	128 / 16	64 QFP	-40°C to 105°C
MCF51AG128VLF	MCF51AG128 ColdFire Microcontroller	128 / 16	48 LQFP	-40°C to 105°C
MCF51AG96VLK	MCF51AG96 ColdFire Microcontroller	96 / 16	80 LQFP	-40°C to 105°C
MCF51AG96VLH	MCF51AG96 ColdFire Microcontroller	96 / 16	64 LQFP	-40°C to 105°C
MCF51AG96VQH	MCF51AG96 ColdFire Microcontroller	96 / 16	64 QFP	-40°C to 105°C
MCF51AG96VLF	MCF51AG96 ColdFire Microcontroller	96 / 16	48 LQFP	-40°C to 105°C

All operating parameters, including "Typicals", must be validated for each customer application by customer's technical experts. Freescale Semiconductor does not convey any license under its patent rights nor the rights of others. Freescale Semiconductor products are not designed, intended, or authorized for use as components in systems intended for surgical implant into the body, or other applications intended to support or sustain life, or for any other application in which the failure of the Freescale Semiconductor product could create a situation where personal injury or death may occur. Should Buyer purchase or use Freescale Semiconductor products for any such unintended or unauthorized application, Buyer shall indemnify and hold Freescale Semiconductor and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that Freescale Semiconductor was negligent regarding the design or manufacture of the part.

RoHS-compliant and/or Pb-free versions of Freescale products have the functionality and electrical characteristics as their non-RoHS-compliant and/or non-Pb-free counterparts. For further information, see <http://www.freescale.com> or contact your Freescale sales representative.

For information on Freescale's Environmental Products program, go to <http://www.freescale.com/epp>.
