

# 3-wire Serial EEPROM 2K (256 x 8 or 128 x 16) and 4K (512 x 8 or 256 x 16)

#### **DATASHEET**

#### **Features**

- Low-voltage Operation
  - V<sub>CC</sub> = 1.7V to 5.5V
- User-selectable Internal Organization
  - 2K: 256 x 8 or 128 x 16
  - 4K: 512 x 8 or 256 x 16
- 3-wire Serial Interface
- Sequential Read Operation
- 2MHz Clock Rate (5V)
- Self-timed Write Cycle (5ms Max)
- High Reliability
  - Endurance: 1,000,000 Write Cycles
  - Data Retention: 100 Years
- 8-lead JEDEC SOIC, 8-lead TSSOP, 8-pad UDFN, 8-pad XDFN, and 8-ball VFBGA packages

#### **Description**

The Atmel® AT93C56B/66B provides 2,048/4,096 bits of Serial Electrically Erasable Programmable Read-Only Memory (EEPROM) organized as 128/256 words of 16 bits each (when the ORG pin is connected to  $V_{\rm CC}$ ) and 256/512 words of 8 bits each (when the ORG pin is tied to ground). The device is optimized for use in many industrial and commercial applications where low-power and low-voltage operations are essential. The AT93C56B/66B is available in space-saving 8-lead JEDEC SOIC, 8-lead TSSOP, 8-pad UDFN, 8-pad XDFN, and 8-ball VFBGA packages.

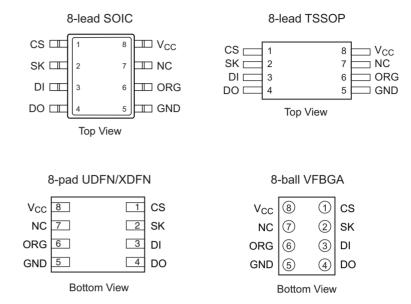

The AT93C56B/66B is enabled through the Chip Select pin (CS) and accessed via a 3-wire serial interface consisting of Data Input (DI), Data Output (DO), and Shift Clock (SK). Upon receiving a Read instruction at DI, the address is decoded, and the data is clocked out serially on the DO pin. The write cycle is completely self-timed, and no separate erase cycle is required before Write. The write cycle is only enabled when the part is in the Erase/Write Enable state. When CS is brought high following the initiation of a write cycle, the DO pin outputs the Ready/Busy status of the part.

The AT93C56B/66B operates from 1.7V to 5.5V.

### 1. Pin Configurations and Pinouts

Table 1-1. Pin Configurations

Pin Name	Function
CS	Chip Select
SK	Serial Data Clock
DI	Serial Data Input
DO	Serial Data Output
GND	Ground
V <sub>CC</sub>	Power Supply
ORG	Internal Organization
NC	No Connect

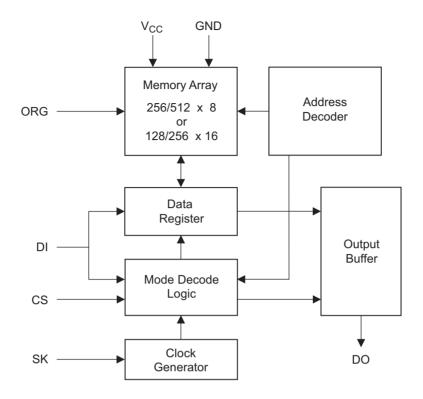

Note: Drawings are not to scale.

### 2. Absolute Maximum Ratings\*

Operating Temperature55°C to +125°C
Storage Temperature65°C to +150°C
Voltage on any pin with respect to ground1.0V to +7.0V
Maximum Operating Voltage 6.25V
DC Output Current

\*Notice: Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

# 3. Block Diagram

Note: When the ORG pin is connected to  $V_{CC}$ , the x16 organization is selected. When it is connected to ground, the x8 organization is selected. If the ORG pin is left unconnected, and the application does not load the input beyond the capability of the internal  $1M\Omega$  pull-up resistor, then the x16 organization is selected.

#### **Memory Organization** 4.

#### Pin Capacitance<sup>(1)</sup> 4.1

Applicable over recommended operating range from  $T_A$  = 25°C, f = 1.0MHz,  $V_{CC}$  = 5.0V (unless otherwise noted).

Symbol	Test Conditions	Max	Units	Conditions
C <sub>OUT</sub>	Output Capacitance (DO)	5	pF	V <sub>OUT</sub> = 0V
C <sub>IN</sub>	Input Capacitance (CS, SK, DI)	5	pF	V <sub>IN</sub> = 0V

Note: 1. This parameter is characterized, and is not 100% tested.

#### 4.2 **DC Characteristics**

Applicable over recommended operating range from  $T_{AI}$  = -40°C to +85°C,  $V_{CC}$  = 1.7V to 5.5V (unless otherwise noted).

Symbol	Parameter	Test Condition	Min	Тур	Max	Unit	
V <sub>CC1</sub>	Supply Voltage		1.7		5.5	V	
V <sub>CC2</sub>	Supply Voltage			2.5		5.5	V
V <sub>CC3</sub>	Supply Voltage			4.5		5.5	V
,	Cumply Current	V - F 0V	Read at 1.0MHz		0.5	2.0	mA
I <sub>cc</sub>	Supply Current	V <sub>CC</sub> = 5.0V	Write at 1.0MHz		0.5	2.0	mA
I <sub>SB1</sub>	Standby Current	V <sub>CC</sub> = 1.7V	CS = 0V		0.4	1.0	μΑ
I <sub>SB2</sub>	Standby Current	V <sub>CC</sub> = 2.5V	CS = 0V		6.0	10.0	μΑ
I <sub>SB3</sub>	Standby Current	V <sub>CC</sub> = 5.0V	CS = 0V		10.0	15.0	μA
I <sub>IL</sub>	Input Leakage	V <sub>IN</sub> = 0V to V <sub>CC</sub>	<u>'</u>		0.1	3.0	μΑ
I <sub>OL</sub>	Output Leakage	V <sub>IN</sub> = 0V to V <sub>CC</sub>			0.1	3.0	μΑ
V <sub>IL1</sub> <sup>(1)</sup>	Input Low Voltage	$2.5V \leq V_{CC} \leq 5.5V$		-0.6		0.8	V
V <sub>IH1</sub> <sup>(1)</sup>	Input High Voltage	$2.5V \leq V_{CC} \leq 5.5V$		2.0		V <sub>CC</sub> + 1	V
V <sub>IL2</sub> <sup>(1)</sup>	Input Low Voltage	$1.7V \leq V_{CC} \leq 2.5V$		-0.6		V <sub>CC</sub> x 0.3	V
V <sub>IH2</sub> <sup>(1)</sup>	Input High Voltage	$1.7V \leq V_{CC} \leq 2.5V$		V <sub>CC</sub> x 0.7		V <sub>CC</sub> + 1	V
V <sub>OL1</sub>	Output Low Voltage	$2.5V \leq V_{CC} \leq 5.5V$	I <sub>OL</sub> = 2.1mA			0.4	V
V <sub>OH1</sub>	Output High Voltage	$2.5 \text{V} \leq \text{V}_{\text{CC}} \leq 5.5 \text{V}$	I <sub>OH</sub> = -0.4mA	2.4			V
V <sub>OL2</sub>	Output Low Voltage	$1.7V \le V_{CC} \le 2.5V$	I <sub>OL</sub> = 0.15mA			0.2	V
V <sub>OH2</sub>	Output High Voltage	$1.7 \text{V} \leq \text{V}_{\text{CC}} \leq 2.5 \text{V}$	I <sub>OH</sub> = -100μA	V <sub>CC</sub> - 0.2			V

Note: 1.  $V_{IL}$  min and  $V_{IH}$  max are reference only, and are not tested.

### 4.3 AC Characteristics

Applicable over recommended operating range from  $T_{AI}$  = -40°C to + 85°C,  $V_{CC}$  = as specified, CL = 1 TTL gate and 100pF (unless otherwise noted).

Symbol	Parameter	Test Condition	1	Min	Max	Units
		4.5V ≤ V <sub>CC</sub> ≤ 5	$4.5V \leq V_{CC} \leq 5.5V$		2	MHz
f <sub>SK</sub>	SK Clock Frequency	2.5V ≤ V <sub>CC</sub> ≤ 5	$2.5V \le V_{CC} \le 5.5V$			MHz
		1.7V ≤ V <sub>CC</sub> ≤ 5	.5V	0	250	kHz
4	CV High Time	$2.5V \le V_{CC} \le 5$	.5V	250		ns
t <sub>SKH</sub>	SK High Time	1.7V ≤ V <sub>CC</sub> ≤ 5	.5V	1000		ns
+	SK Low Time	2.5V ≤ V <sub>CC</sub> ≤ 5	.5V	250		ns

Note: 1. This parameter is characterized, and is not 100% tested.

### 5. Functional Description

The AT93C56B/66B is accessed via a simple and versatile 3-wire serial communication interface. Device operation is controlled by seven instructions issued by the Host processor. A valid instruction starts with a rising edge of CS and consists of a Start bit (Logic 1), followed by the appropriate opcode, and the desired memory address location.

Table 5-1. AT93C56B/66B Instruction Set

			Addr	ess	Data		
Instruction	SB	Opcode	<b>x8</b> <sup>(1)</sup>	<b>x16</b> <sup>(1)</sup>	x8	x16	Comments
READ	1	10	$A_8 - A_0$	$A_7 - A_0$			Reads data stored in memory at specified address.
EWEN	1	00	11XXXXXXX	11XXXXXX			Write Enable must precede all programming modes.
ERASE	1	11	$A_8 - A_0$	$A_7 - A_0$			Erases memory location A <sub>N</sub> – A <sub>0</sub> .
WRITE	1	01	$A_8 - A_0$	$A_7 - A_0$	D <sub>7</sub> – D <sub>0</sub>	D <sub>15</sub> – D <sub>0</sub>	Writes memory location $A_N - A_0$ .
ERAL	1	00	10XXXXXXX	10XXXXXX			Erases all memory locations.  Valid only at V <sub>CC3</sub> (Section 4.2, "DC Characteristics" on page 4).
WRAL	1	00	01XXXXXXX	01XXXXXX	D <sub>7</sub> – D <sub>0</sub>	D <sub>15</sub> – D <sub>0</sub>	Writes all memory locations. Valid only at $V_{\text{CC3}}$ (Section 4.2) and Disable Register cleared.
EWDS	1	00	00XXXXXXX	00XXXXXX			Disables all programming instructions.

Note: 1. The Xs in the address field represent don't care values, and must be clocked.

**READ:** The READ instruction contains the address code for the memory location to be read. After the instruction and address are decoded, data from the selected memory location is available at the Serial Output pin, DO. Output data changes are synchronized with the rising edges of the Serial Clock pin, SK. It should be noted that a dummy bit (Logic 0) precedes the 8-bit or 16-bit data output string. The AT93C56B/66B supports sequential Read operations. The device will automatically increment the internal address pointer and clock out the next memory location as long as Chip Select (CS) is held high. In this case, the dummy bit (Logic 0) will not be clocked out between memory locations, thus allowing for a continuous stream of data to be read.

**Erase/Write Enable (EWEN):** To ensure data integrity, the part automatically goes into the Erase/Write Disable (EWDS) state when power is first applied. An Erase/Write Enable (EWEN) instruction must be executed first before any programming instructions can be carried out.

Note: Once in the EWEN state, programming remains enabled until an EWDS instruction is executed, or V<sub>CC</sub> power is removed from the part.

**ERASE**: The ERASE instruction programs all bits in the specified memory location to the Logic 1 state. The self-timed erase cycle starts once the ERASE instruction and address are decoded. The DO pin outputs the Ready/Busy status of the part if CS is brought high after being kept low for a minimum of  $t_{CS}$ . A Logic 1 at the DO pin indicates that the selected memory location has been erased, and the part is ready for another instruction.

**WRITE:** The WRITE instruction contains the 8-bits or 16-bits of data to be written into the specified memory location. The self-timed programming cycle,  $t_{WP}$ , starts after the last bit of data is received at Serial Data Input pin DI. The DO pin outputs the Ready/Busy status of the part if CS is brought high after being kept low for a minimum of  $t_{CS}$ . A

Logic 0 at DO indicates that programming is still in progress. A Logic 1 indicates that the memory location at the specified address has been written with the data pattern contained in the instruction, and the part is ready for further instructions. A Ready/Busy status cannot be obtained if CS is brought high after the end of the self-timed programming cycle,  $t_{WP}$ .

**Erase All (ERAL):** The Erase All (ERAL) instruction programs every bit in the Memory Array to the Logic 1 state and is primarily used for testing purposes. The DO pin outputs the ready/busy status of the part if CS is brought high after being kept low for a minimum of  $t_{CS}$ . The ERAL instruction is valid only at  $V_{CC3}$  (Section 4.2, "DC Characteristics" on page 4).

**Write All (WRAL):** The Write All (WRAL) instruction programs all memory locations with the data patterns specified in the instruction. The DO pin outputs the Ready/Busy status of the part if CS is brought high after being kept low for a minimum of  $t_{CS}$ . The WRAL instruction is valid only at  $V_{CC3}$  (Section 4.2).

**Erase/Write Disable (EWDS):** To protect against accidental data disturbance, the Erase/Write Disable (EWDS) instruction disables all programming modes and should be executed after all programming operations. The operation of the Read instruction is independent of both the EWEN and EWDS instructions and can be executed at any time.
