EVAL BOARD USER'S MANUAL

Introduction

This document gives a detailed description of the NCN8024R Evaluation Boards (SOIC-28 version) with the Bill Of Material (BOM), board schematic and layout. The appropriate lab test setup is also provided. The NCN8024R Evaluation Boards have been designed to help for a quick evaluation of the NCN8024R Smart card interface device.

This document has to be used with the NCN8024R datasheet. The datasheet contains full technical details regarding the NCN8024R specifications and operation. The board (FR4 material) is implemented in two metal layers. The top and Bottom layers have thicknesses of 35 μm . The PCB thickness is 1.6 mm with dimensions of 100 mm by 74 mm (see Figure 1).

These evaluation boards can be used to evaluate the device performance. This evaluation board is the same than the NCN8024 device. C1 and C2 not populated constitute the only difference with the NCN8024 Evaluation Board.

Figure 1. Evaluation Board – SOIC-28

Table 1. EQUIPMENT

Description	Main Features	Example of Equipment (Note 1)	Qty
Regulated Power Supply	200 mA DC Current Capability	Tektronix PS2520G	2
Multimeter		Keitley 2000 or 2001	2
Sourcemeter		Keitley 2400	1
Oscilloscope	500 MHz Bandwidth, Four Channel Scope, Min 1 Mbit Memory per Channel (Note 2)	Tecktronix TDS744, 754 or 784/TDS5054 Series or Lecroy WR5060 TDS5104B, 1 GHz, 5GS/s	1
Voltage Probe	4 Probes 500 MHz Bandwidth	Tektronix or Lecroy	4
Waveform Generator	Pattern Genarator	Agilent 81104A 80 MHz or HP8110A 150 MHz 2 Outputs	1
SMB Cable		External Clock Input	1

1. Equipment used in the context of this Application Note Manual.
2. Greater Scope memory per channel offers better resolution.

NCN8024RGEVB

Test Procedure

See Figure 2.

Initial Setups (Figure 2)

The initial setups given here are recommended before starting measurements on the board.

- Set the CMDVCC/in the OFF Position (High)
- Set CLKDIV1 and CLKDIV2 into Low Position (Lowest Frequency Fclkin)
- Set 5V/3Vbar into a 5V Position
- As a Precaution, Turn the 1 kΩ Potentiometer to Obtain a Resistor Output Value of 1 kΩ, and then Connect the Jumper

DC Power Supplies

Two power supplies are used to bias the demo board. V_{DDP} is the input voltage of the DC-DC converter. V_{DD} is the “digital” power supply which biases the input stages of the NCN8024 device (control and signal inputs).

V_{DD} and V_{DDP} must be connected to the board for a correct operation.

- Connect the V_{DD} Power Supply Using the 2 Pin Male Connector J1
- Connect the V_{DDP} Power Supply Using the 2 Pin Male Connector J2
- Power up V_{DDP} in the Range 4.85 V–5.5 V
- Power up V_{DD} in the Range 2.7 V–5.5 V

Clock Frequency

CLKDIV1 and CLKDIV2 select the frequency divider according to the Table 2.

Table 2. CLOCK FREQUENCY

CLKDIV1	CLKDIV2	Divider
1	0	DIV 1/1
1	1	DIV 1/2
0	1	DIV 1/4
0	0	DIV 1/8

Card Presence

The socket we use is a normally open, so CDR-PRES/ has been chosen; nevertheless the CRD_PRES and CRD_PRES/ test points can also be used for signaling the presence of a card and starting up the circuit.

Start the Measurement

To start the measurements, set the board as it follows:

- Set CLKDIV1 and CLKDIV2 to Select the Correct Frequency
- Set 5V/3Vbar to Select the Correct Output Voltage
- Jumpers:
 - ♦ 1 kΩ Potentiometer Jumper: Not Connected to Start Measurement
- Finally, Toggle/CMDVCC from High to Low to Start the Device (Activation Sequence Run)
