General Description

The HMC474MP86 & HMC474MP86E are general purpose SiGe Heterojunction Bipolar Transistor (HBT) Gain Block MMIC SMT amplifiers covering DC to 6 GHz. This Micro-P packaged amplifier can be used as a cascadable 50 Ohm RF/IF gain stage with up to +10 dBm output power. The HMC474MP86(E) offer 15.5 dB of gain with a +22 dBm output IP3 at 850 MHz while requiring only 25 mA from a single positive supply. The Darlington feedback pair used results in reduced sensitivity to normal process variations and excellent gain stability over temperature while requiring a minimal number of external bias components.

Electrical Specifications, $V_s = 5V$, $R_{bias} = 110 \text{ Ohm}$, $T_A = +25^\circ \text{ C}$

[2] Circuit Board Material: Rogers 4350

The circuit board used in the final application should use RF circuit design techniques. Signal lines should have 50 ohm impedance while the package ground leads should be connected directly to the ground plane similar to that shown. A sufficient number of via holes should be used to connect the top and bottom ground planes. The evaluation board should be mounted to an appropriate heat sink. The evaluation circuit board shown is available from Hittite upon request.
