### Functional Diagram

### General Description

The HMC622LP4E is a highly integrated converter IC that operates from 1.8 to 3.9 GHz for both up-conversion and downconversion applications. The HMC622LP4E incorporates a high dynamic range, double-balanced mixer core with integrated LO and IF amplifiers, making it ideal for compact transceiver applications in GSM, WCDMA, TD-SCDMA, WiBro and WiMAX. This versatile converter RFIC operates with a low LO input power level of only +3 dBm, provides up to 10 dB conversion gain, and exhibits +23 dBm Input IP3 in downconversion mode. This RFIC provides up to 12 dB conversion gain in upconverter mode. Specific evaluation boards are available for both upconversion and downconversion modes.

**Pin Descriptions (Continued)**

Pin Number	Function	Description	Interface Schematic
7	IFIN	This pin is matched to 50 ohms with a 51nH inductor to ground. See Application Circuit.	IFIN 
9	CAP	AC ground. An external capacitor of 0.01 $\mu$ F to ground is required for low frequency bypassing. See application circuit for further details.	VddIF 
10	MIXIF	This pin is DC coupled. For applications not requiring operation to DC, this port should be DC blocked externally using a series capacitor whose value has been chosen to pass the necessary IF frequency range. For operation to DC, this pin must not source/sink more than 18 mA of current or part non-function and possible part failure will result.	MIXIF 
12	IFOUT	This pin is AC coupled and matched to 50 Ohms.	 IFOUT
13	VddIF	Power supply for IF amplifier. Choke inductor and bypass capacitor are required. See application circuit.	VddIF 
16	MIXLO	This pin is DC coupled and matched to 50 Ohms. An off chip DC blocking capacitor is required.	MIXLO 
17	GND	Backside of package has exposed metal ground paddle that must also be connected to ground.	GND 
18	BIAS	Power supply and RF Output of the LO amplifier. Three external bypass capacitors are recommended for optimum performance, as illustrated in the application circuit.	BIAS 
21	LO	This pin is DC coupled and matched to 50 Ohms. An off chip DC blocking capacitor is required. See application circuit.	LO

The circuit board used in the final application should use RF circuit design techniques. Signal lines should have 50 ohm impedance while the package ground leads and exposed paddle should be connected directly to the ground plane similar to that shown. A sufficient number of via holes should be used to connect the top and bottom ground planes. The evaluation circuit board shown is available from Hittite upon request.
